

Health Statistics

Health Statistics

Health

Purpose

To provide policy makers and health care researchers with core data on health care resources, their utilisation, expenditure and financing. This is complemented by a broader range of data on health status, life style, and other data on the socio-economic environment of health care systems in OECD countries, in order to provide data on the context of health care systems for policy analysis.

To provide necessary information to the "OECD Health Project 2001-2004".

Objectives and outputs

Further work on data on health care resource statistics and utilisation statistics in non-monetary terms as well as coverage of the population by insurance schemes; and access to services. On-going co-operation with Eurostat, WHO Geneva, WHO European Region. Follow-up, pilot testing and adoption of the OECD manual "A System of Health Accounts" (SHA). Improving the comparability of existing data collections on health resource and utilisation data, surgical procedures, and pharmaceutical consumption and sales.

In 2003 a special effort will be made to set up a data collection on income of health professions, improve expenditure on long-term nursing care and draft a synthesis from pilot implementations of the OECD manual "A System of Health Accounts".

OECD Health Data 2003

Main Developments for 2003

General aspects:

Enhanced coverage and improved internal consistency of health accounts in OECD Health Data 2003; income of health professions; long-term care statistics.

Data collection:

Improvement in health care resources data; in remuneration of health professions data; in expenditure data (following the SHA pilot implementations).

Enhanced Sources and Methods software for the CD-ROM.

Data management:

Improvement in the user-friendliness of the software to manage the Sources and Methods (currently being developed by CREDES)
