

OECD System of Unit Labour Cost and Related Indicators

News Release

Growth in unit labour costs remained at 1.0% in OECD countries in first quarter of 2009

Unit labour cost growth for the **total economy** remained largely steady for most OECD countries in the first quarter of 2009 as sharp falls in real output (gross domestic product at constant prices) due to the economic crisis were mostly offset by lower total labour costs. The rise in unit labour costs for the **major seven** economies was 0.9% and for the **Euro area** 1.6%.

Unit labour costs in the **market services** sector for the **OECD area** grew 0.6% in the first quarter of 2009 following a 0.9% rise in the fourth quarter of 2008. They were up 2.6% on an annual basis. Overall, unit labour cost growth rates in **market services** either slowed or remained unchanged for most **OECD** economies in the first quarter of 2009. Unit labour costs continued to fall in **Poland** and the **United Kingdom** in the first quarter, as labour costs declined faster than real output in market services.

Unit labour costs rose 1.6% in **industry** for the **OECD area** in the first quarter; a 6.0% increase year-on-year. The data shows marked differences between the main export-based economies despite the global crisis. **Industry** unit labour costs remained unchanged in Germany but rose 3.1% in Japan.

All references to growth are to trend-cycle data.

Quarterly Unit Labour Costs
Percentage change on the previous quarter (trend-cycle data)
Total Economy

Industry – ISIC Divisions: Mining and quarrying (C); Manufacturing (D); and Electricity, gas and water supply (E).
 Market Services – ISIC Divisions: Wholesale and retail trade (G); Hotels and restaurants (H); Transport, storage and communication (I); Financial intermediation (J); and Real estate, renting and business activities (K).

Full time series for all countries are available at:

<http://stats.oecd.org/WBOS/Default.aspx?QueryName=427&QueryType=View&Lang=en>

Notes:

1. An increase in unit labour costs indicates that growth in average employee compensation exceeds growth in labour productivity, which may create pressure on producer prices.
2. The trend-cycle data can be interpreted as a short-term trend or smoothed seasonally adjusted series, where the degree of smoothing depends on the historical volatility of the series and will thus vary from country to country.
3. Excludes Switzerland.
4. Figures for the first quarter 2009 are estimates.
5. Last data point for quarterly compensation of employees received from National Statistics Office of Turkey (TurkStat) is Q4 2006.

OECD System of Unit Labour Cost and Related Indicators

Methodological Notes

Unit labour costs measure the average cost of labour per unit of output. They are calculated as the ratio of total labour costs to real output, or equivalently, as the ratio of mean labour costs per hour to labour productivity (output per hour). As such, a unit labour cost (ULC) represents a link between productivity and the cost of labour in producing output. An increase in unit labour costs indicates that growth in average employee compensation exceeds growth in labour productivity, which may create pressure on producer prices.

The *OECD System of Unit Labour Cost Indicators* compiles annual and quarterly ULC and related indicators according to a specific methodology to ensure data are comparable across countries. This system is principally based on national accounts concepts and data but also brings together a wide range of proxy sources for quarterly data. The compilation of the quarterly ULC indicators presented in this news release involves the following stepwise process:

- Identifying suitable quarterly indicator data. The target variable for total labour costs is compensation of employees and proxy variables in order of preference include: gross wages and salaries; labour cost index multiplied by hours worked; earnings or wage series multiplied by total employment. The target variable for real output is constant price value added with production indices being used as proxies if required and available.
- Benchmarking to more reliable annual data to form a consistent set of temporally disaggregated quarterly time series of total labour costs and real output.
- Taking the quotient of the above input series as the raw ULC series and deriving both seasonally adjusted and trend-cycle series, the latter being a combination of a long-term trend and business cycle series, produced using the TRAMO-SEATS software.

Given the inherent volatility in a derived indicator such as the unit labour cost, the OECD presents the trend-cycle series as the headline indicator in this news release, for the key economic sectors of industry and market services. The [trend-cycle series](#) can be regarded as a short-term trend or smoothed seasonally adjusted series, where the degree of smoothing is dependent on the historical volatility of the series and will thus vary from country to country.

All time series together with detailed methodological information and country data sources are freely available through the OECD System of Unit Labour Cost Indicators web portal at: <http://stats.oecd.org/mei/default.asp?rev=3>. Data are available for all OECD Member countries and the Euro area for total economy, manufacturing, industry, construction, trade transport & communication, financial and business services, market services and the business sector excluding agriculture. Quarterly data are available as raw, seasonally adjusted and trend-cycle series. Annual time series also include related series such as labour productivity, labour compensation per unit labour input, exchange rate adjusted ULC and labour income share ratios. The latter variables can differ from other data sources, such as the OECD Structural Analysis and Productivity Databases, due to statistical coverage, frequency of updates or other comparability issues. Users are therefore encouraged to refer to the methodological information provided for more detailed explanations.
