The Czech experimental calculations in health

1. Present appearance of calculation of health output in the Czech national accounts.

We accept health as a market service, even if there is public health insurance in the Czech Republic. Majority of health output is formed from payments from health insurance companies. The health insurance companies belong to the sector of government institutions.

2. Consumer price index – we will use only for the part of health output, that only households pay
3. Experimental calculation of health volume measurement – it is composed of two indices:
 - for services to inpatients – based on number of inpatients cases in ICD classification and costs of health insurance companies.
 - For outpatient health care – based on number of outpatient examinations according to particular branches and costs of outpatient health care are divided according to units. These costs are paid by health insurance companies.

CZSO uses method unit costs on the both calculations. This calculation is without quality adjustments.
