

Linking mitigation actions with
support:
From a conceptual framework to its
operationalisation

Joy Aeree Kim

8 June 2009

AIXG side event, Bonn

Outline

Conceptual framework

- A process for linking actions with support
- Definitions
- Key questions arising in the linking process
- Goals of an effective linking framework
- Key criteria of an effective linking framework

Operationalisation

- Key questions

Definitions

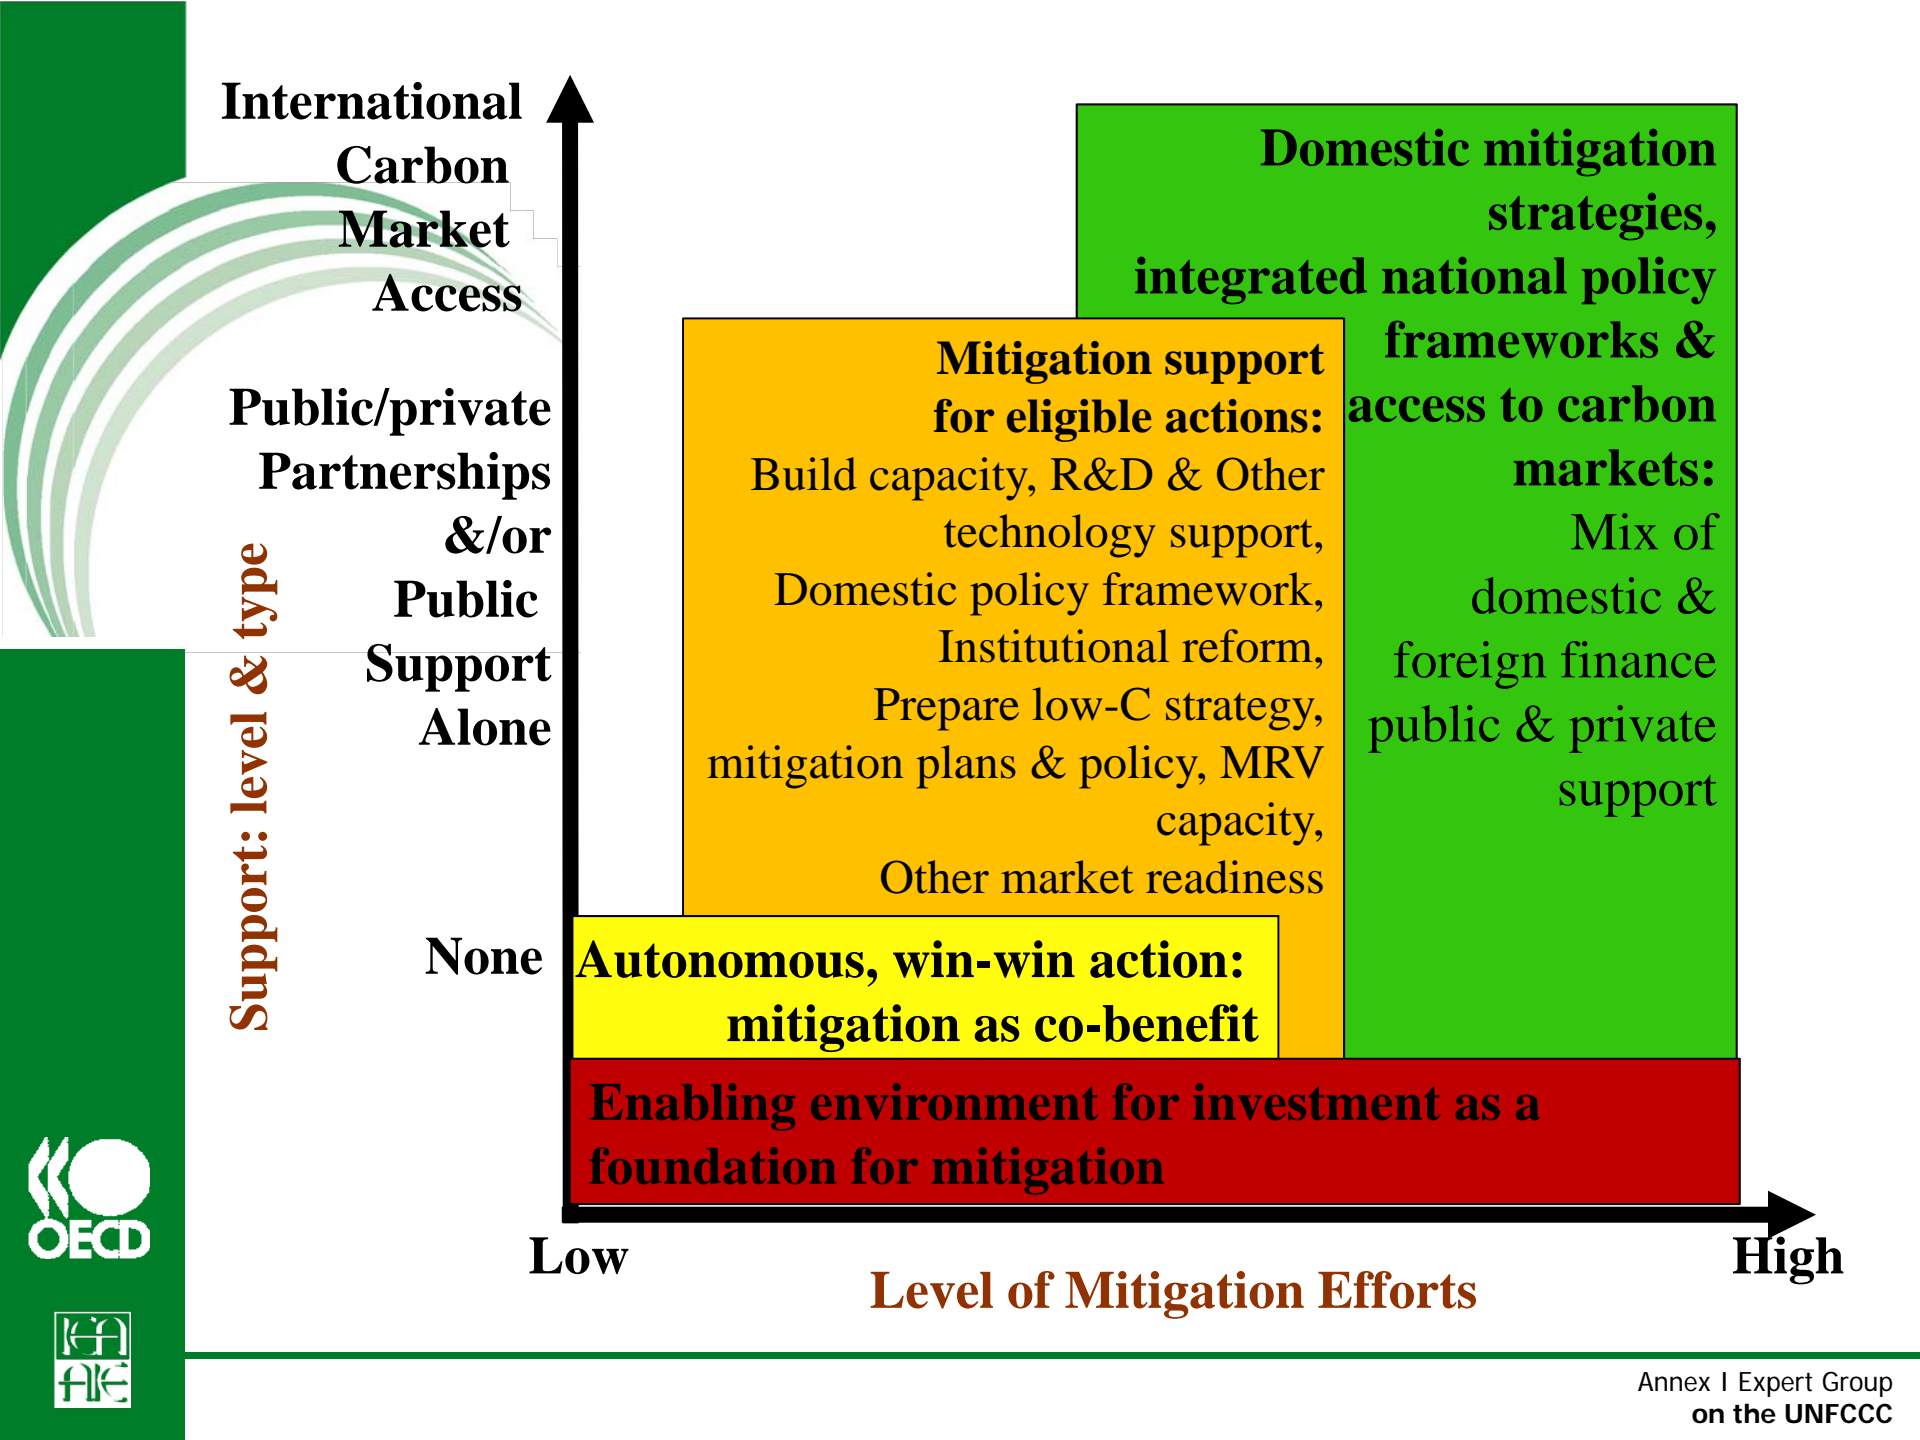

- NAMAs
 - ◆ Both climate-specific and climate-relevant actions
- Domestic implementation requirements
 - ◆ Changes in various inputs (institutions, productive capital and technology) to turn mitigation potentials and support policy options into actions
- Support
 - ◆ Financing, capacity building and technology support from the public and private sector – focus on support between “contributor” (or donor) and recipient countries

Key questions arising in the linking process

- How to ensure that NAMAs deliver cost-effective, measurable and additional GHG mitigation?
- How much will the implementation of NAMAs cost?
- What support does Country A need to implement the NAMAs? for which actions? How to evaluate such needs?
- How can available public resources for mitigation support be best directed to maximise mitigation results?
- What eligibility criteria and priorities for spending should guide decisions on where to direct mitigation support?

Minimum eligibility criteria

- Existence of a national GHG mitigation strategy
- Internationally harmonised national GHG inventory data/documentation of past emission trends
- Demonstration of potential of the mitigation project/strategy
- Consistency of the mitigation strategy with relevant national development plans
- Ability to leverage finance toward GHG friendly investments

International Carbon Market Access

Public/private Partnerships &/or Public Support Alone

Support: level & type

None

Autonomous, win-win action: mitigation as co-benefit

Mitigation support for eligible actions:
 Build capacity, R&D & Other technology support,
 Domestic policy framework, Institutional reform,
 Prepare low-C strategy, mitigation plans & policy, MRV capacity,
 Other market readiness

Domestic mitigation strategies, integrated national policy frameworks & access to carbon markets:
 Mix of domestic & foreign finance public & private support

Enabling environment for investment as a foundation for mitigation

Low

Level of Mitigation Efforts

High

Operationalising the framework

- How to channel support? (through bilateral model, centralised model or hybrid one?)
- What institutional arrangement might be needed for different models?
- What's the strength and weakness of such models?
- What criteria might be needed for eligibility and prioritisation of support?
- Crediting: how could this work?
- How to evaluate the effectiveness of support?

Thank you !
