

Norway

Norwegians enjoy one of the highest GDP per capita in the OECD. Norway is a very high-income economy, with a GDP per capita above the average of most advanced economies, even once offshore petroleum production is excluded. This reflects largely high labour productivity, measured as GDP per hour worked. Participation in the labour market and employment rates are also high – for both men and women. However, hours worked are among the lowest in the OECD, partly explained by the high share of part-time employment. In the recent years, growth in GDP per capita has decelerated together with employment and labour productivity growth.

A very high-income country

NORWAY	Pre-crisis 2003-08	Post-crisis 2011-16
<i>Levels</i>		
GDP per capita**	44208 (33712)*	48353 (35776)*
GDP per hour worked**	61.3 (41.6)*	65.8 (45.6)*
Employment rate, %	76.2 (66.4)*	75.2 (66.8)*
<i>Average annual growth rate</i>		
GDP per capita	3.5 (2.8)*	1.0 (1.4)*
GDP per hour worked	1.3 (2.0)*	1.1 (1.1)*
Employment	2.1 (1.6)*	0.7 (1.0)*
Median household disposable income***		1.6 (1.4)*

Notes: * Unweighted OECD average in brackets.

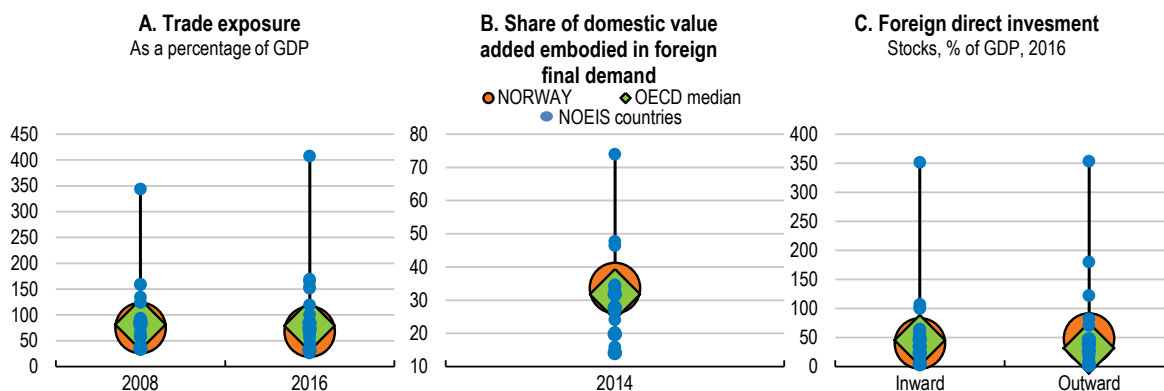

** USD, constant 2010 PPPs and constant prices. Excludes petroleum production and shipping.

*** Data refer to 2011-15 and are deflated by the consumer price index.

Norway is a relatively open economy with exposure to trade slightly below the OECD median. One third of Norway’s domestic value added is embodied in foreign final demand. The import content of gross exports is on the low side, reflecting Norway’s specialisation in oil and gas. Norway is part of the European Free Trade Association (EFTA) -- through which it has negotiated numerous free trade agreements with countries around the world - and has close relations with the EU via the European Economic Area (EEA). Simple average of Most-Favoured Nation tariffs tend to be somewhat higher than in the EU but customs procedures tend to be less burdensome than in most OECD countries. Norway has also a lower score on the STRI than the average in only 7 out of 22 sectors, reflecting general restrictions that apply to most sectors in the economy. Trade in services is lower than in other OECD countries: services account for about one third of Norway’s gross imports and about a fifth of its exports; 60% of imports in value added terms and only 36% of export. The relatively low service content of exports also reflects the significant share of oil and gas exports, which have relatively low services content. Regulatory barriers to FDI are relatively high. Inward investment is slightly below the median OECD country, while foreign-owned enterprises account for one fifth of jobs and value added in the private sector.

A relatively open economy

Norway is one of most inclusive countries in terms of income, employment and gender. The share of income accruing to the poorest households is among the highest in the OECD. This results from relatively low market income inequality, further reduced by significant redistribution through taxes and transfers. Public spending on active labour market policies is high and traditionally disadvantaged groups – such as mothers with young children, immigrants, youth, disabled or older workers – also enjoy relatively high employment rates. PISA scores are generally above the OECD average, while graduation rates are below the OECD average. At the same time, the impact of socio-economic factors on students’ performance at PISA is lower than the OECD average, but providing equality of opportunities to immigrant children through the education system remains an important challenge. Women’s employment rate is high, supported by a good availability of subsidised child-care services and working-time flexibility. The gender gap in earnings of full-time employees is also lower than the OECD average, but many women work part-time.

Norway is among the most inclusive countries in the world

METADATA ANNEX

Economic openness

- **Trade exposure** is defined as exports and imports over GDP.
- **The share of domestic value added embodied in foreign final demand** is defined as domestic value added, from industry, meeting foreign final demand, as a percentage of industry value added. It can be considered as a measure of an industry's reliance on foreign final demand. Here, the denominator is value added adjusted to be consistent with final demand (both domestic and foreign).
- **Foreign Direct Investment stocks** are defined as the total level of direct investment at a given point in time, usually the end of a quarter or of a year. The outward FDI stock is the value of the resident investors' equity in and net loans to enterprises in foreign economies. The inward FDI stock is the value of foreign investors' equity in and net loans to enterprises resident in the reporting economy. For the Netherlands, FDI stock data exclude positions to and from resident Special Purpose Entities (SPEs); SPEs are entities whose role is to facilitate the internal financing of the MNE but that have little or no physical presence in an economy. Excluding such entities from the FDI statistics provides a better measure of the FDI of the country that is having a real impact on its economy.

Trade and FDI

- **The Services Trade Restrictiveness Index (STRI)** identifies which policy measures restrict trade. It provides policy makers information and measurement tools to improve domestic policy environment, negotiate international agreements and open up international trade in services. It can also help governments identify best practice and then focus their domestic reform efforts on priority sectors and measures. The index presented is a geometric average of all sectors and takes value from 0 to 1, where 0 is completely open and 1 is completely closed.
Data are missing for Argentina and Peru.
- **Trade facilitation indicators (TFIs)** identify areas for action and enable the potential impact of reforms to be assessed and help governments to improve their border procedures, reduce trade costs, boost trade flows and reap greater benefits from international trade. The index takes values from 0-2 (least to best performance). The index presented is a simple average over 11 dimensions of the TFI.
Data are missing for Iceland.
- **The FDI regulatory Restrictiveness Index** is gauging the restrictiveness of a country's foreign direct investment rules by looking at four main types of restrictions: foreign equity restrictions, discriminatory screening or approval mechanisms, restrictions on key foreign personnel and operational restrictions. Implementation issues are not addressed and factors such as the degree of transparency or discretion in granting approvals are not taken into account. The index takes values between 0 for open and 1 for closed.

Inequality

- **The share of national disposable income held by the poorest 20% and 40%** is defined as the share of income that accrues to subgroups of population indicated by deciles or quintiles.
For the poorest 20%, data refer to 2014 for Argentina, Germany, Hungary, Luxembourg; 2012 for Japan.
- **The employment gap for disadvantaged groups** is expressed as a percentage of the benchmark group (prime-age male workers). Disadvantaged groups include mothers with young children, youth (15-19 years old) excluding those in full-time education or training, older workers (55-64 years old), non-natives and people with disabilities.
Data are missing for Colombia and Costa Rica in 2006 and for Peru in 2006 and 2016.
- **The gender gap in employment rates** is defined as the difference between employment to population ratios of men and women aged 15-64.
Data refer to 2010 and 2014 for Argentina.

Redistribution, activation and inequality of opportunities

- **The redistribution of the tax and transfers system** is measured as the difference between pre-tax and transfer and post-tax and transfers Gini coefficients, relative to the pre-tax and transfer Gini coefficient. The Gini coefficient measures the extent to which the distribution of income (or, in some cases, consumption expenditure) among individuals or households within an economy deviates from a perfectly equal distribution. The coefficient takes the value of 0 in the case of perfect equality and 100 for perfect inequality.
Data refer to 2014 for Germany, Hungary, Luxembourg and Peru; 2012 for Japan. Data are missing for Argentina and Colombia.
- **Public expenditure on active labour market policies per unemployed** are measured by all social expenditure (other than education) which is aimed at the improvement of the beneficiaries' prospect of finding gainful employment or to otherwise increase their earnings capacity. It includes spending on public employment services and administration, labour market training, special programmes for youth when in transition from school to work, labour market programmes to provide or promote employment for unemployed and other persons (excluding young and disabled persons) and special programmes for the disabled. Data are expressed as a percentage of GDP per capita. Original data can be accessed under: <http://stats.oecd.org/Index.aspx?DataSetCode=LMPEXP>. *Data are missing for Argentina, Colombia, Costa Rica and Peru. For Canada, data include federal expenditures on programmes implemented by the provinces and territories, but do not generally include the provinces' and territories' additional or complementary funding of these programmes.*
- **Differences in PISA mean scores (average of mathematics and science) between natives and first and second generations of immigrants.** PISA assesses the extent to which 15-year-old students, near the end of their compulsory education, have acquired key knowledge and skills that are essential for full participation in modern societies
Data are missing for Japan, Poland and Peru. For Argentina, data refer to the region of the capital city of Buenos Aires.
- **The variance of educational achievement** is measured as the total variance in PISA scores in reading, mathematics and science, compared to the OECD (OECD=100). The Programme for International Student Assessment (PISA) assesses the extent to which 15-year-old students, near the end of their compulsory education, have acquired key knowledge and skills that are essential for full participation in modern societies. The variance components in mathematics, sciences and reading were estimated for all students in participating countries with data on socio-economic background and study programmes. The variance in student performance is calculated as the square of the standard deviation of PISA scores in reading, mathematics and science for the sample of students used in the analysis.
For France, average of PISA scores in mathematics and reading only in 2015. For Argentina, data refer to the region of the capital city of Buenos Aires.
