

OECD FORECASTS DURING & AFTER THE FINANCIAL CRISIS

A POST-MORTEM

OECD-BLOOMBERG EVENT
11 February 2014

Pier Carlo Padoan
OECD Deputy Secretary General
Chief Economist

The crisis and the recovery have been exceptional

Forecasts missed the downturn....

% Forecasts of GDP growth in 2008

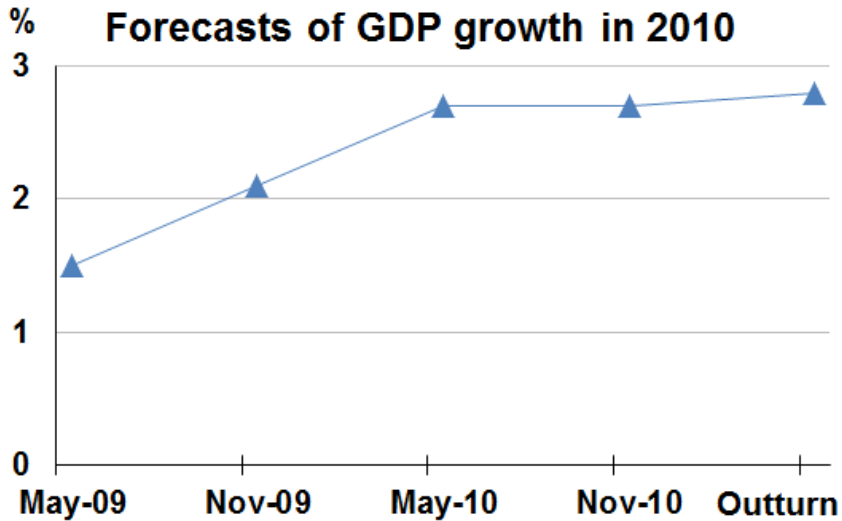

% Forecasts of GDP growth in 2009

Successive forecasts of Q4-on-Q4 OECD GDP growth

...and accuracy was mixed during the recovery

Successive forecasts of Q4-on-Q4 OECD GDP growth

Forecast errors in the crisis were comparable to the first oil shock in the 1970s

UK forecast errors are similar to those of other G7 economies

Error in GDP growth forecast

November forecast for next year

May forecast for next year

Forecast errors were largest in the vulnerable euro area countries

What can explain the forecast errors? Could they have been avoided?

Two approaches:

1. Comparing errors with data available at the time

These data could have helped to reduce our forecast errors

2. Comparing errors with data available now
(not available at the time)

These data help identify the “shocks”

The downturn was deeper than projected in more open economies

Cumulative errors in May 2008 forecasts for GDP growth in 2008-09

Forecasts were too optimistic for countries with lower pre-crisis bank capital

Growth forecast errors for 2010-11, from May 2010

Growth forecasts were less accurate in more heavily regulated economies

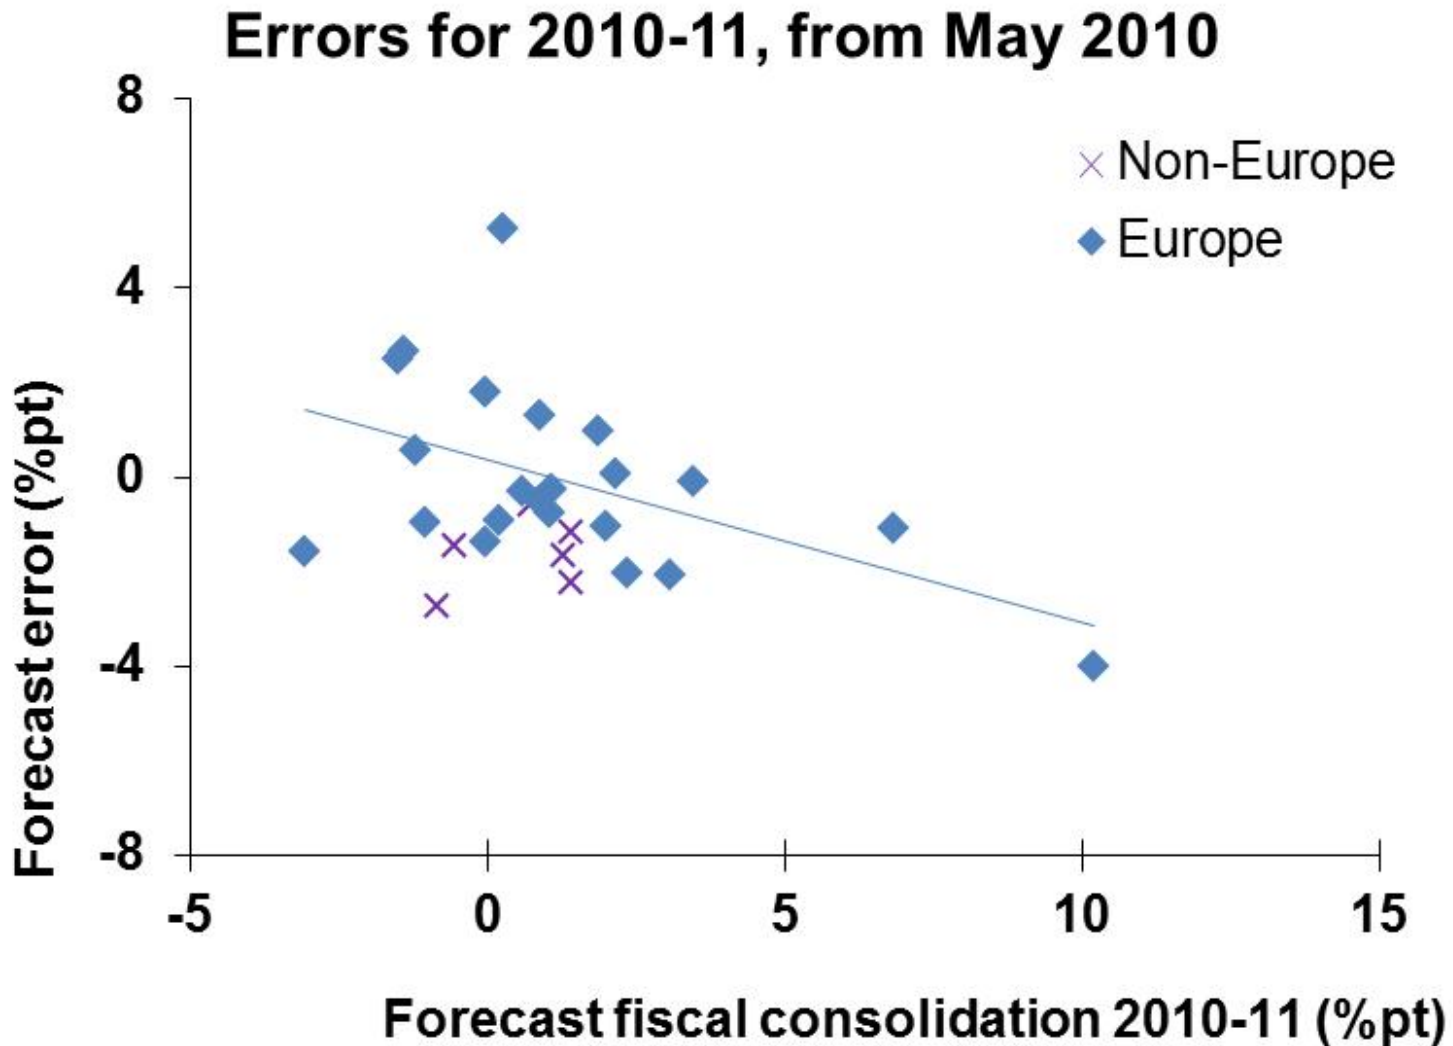

Accuracy of November projections for next year

Indicators are the OECD product market regulation index and the OECD measure of the strictness of employment protection (for regular workers)

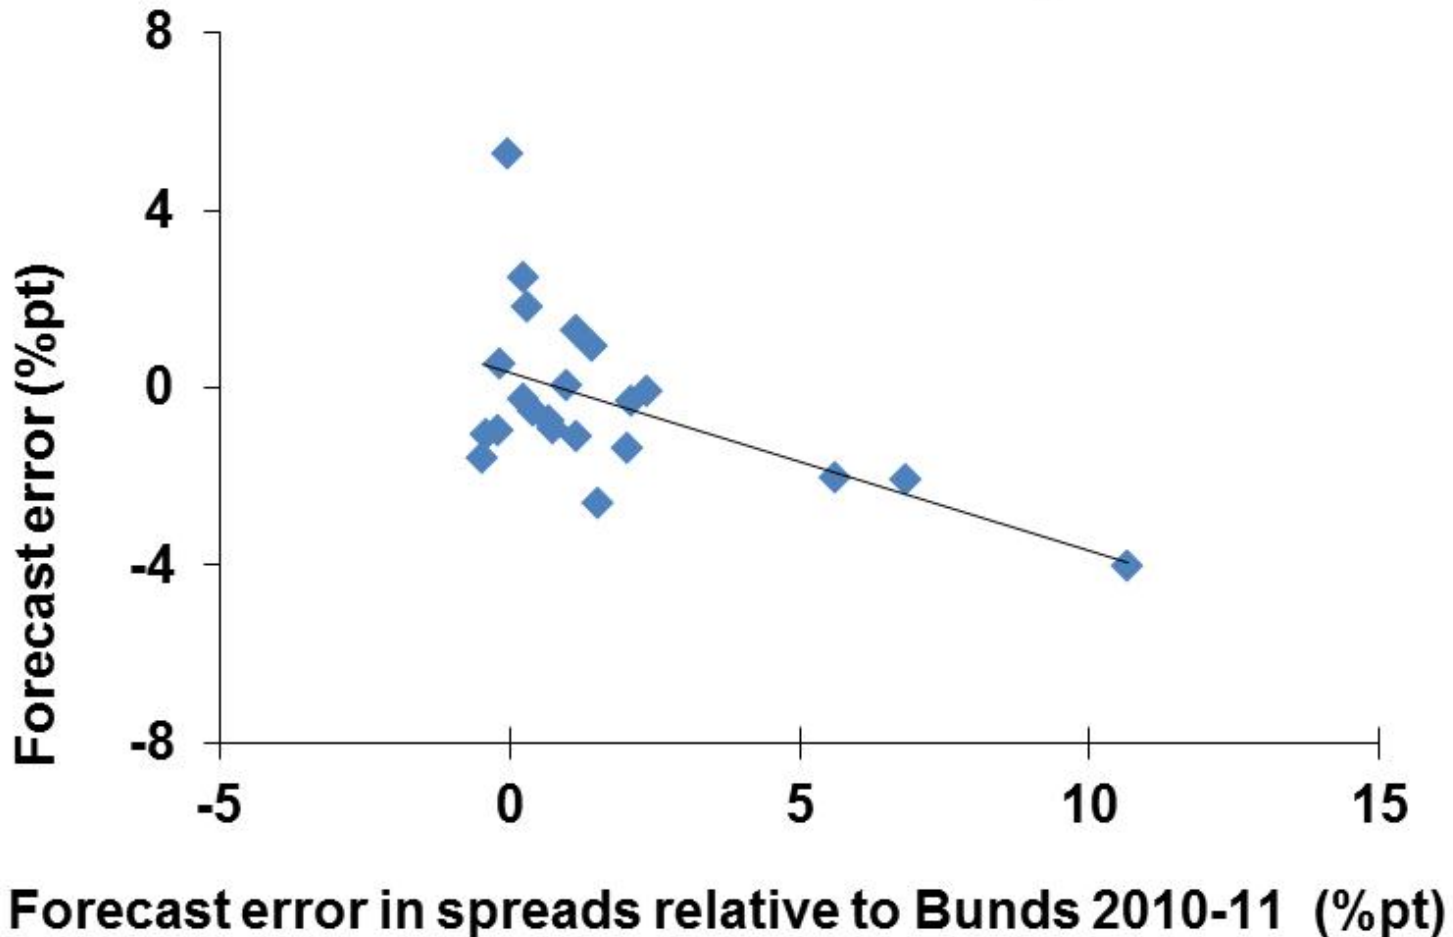

Were we too optimistic about the negative impact of fiscal consolidation?

The intensification of the euro area crisis was a more important source of growth forecast errors

Errors for 2010-11, from May 2010

“By seeking and blundering,
we learn.”

Goethe

Lesson 1 – get better at spotting downturns

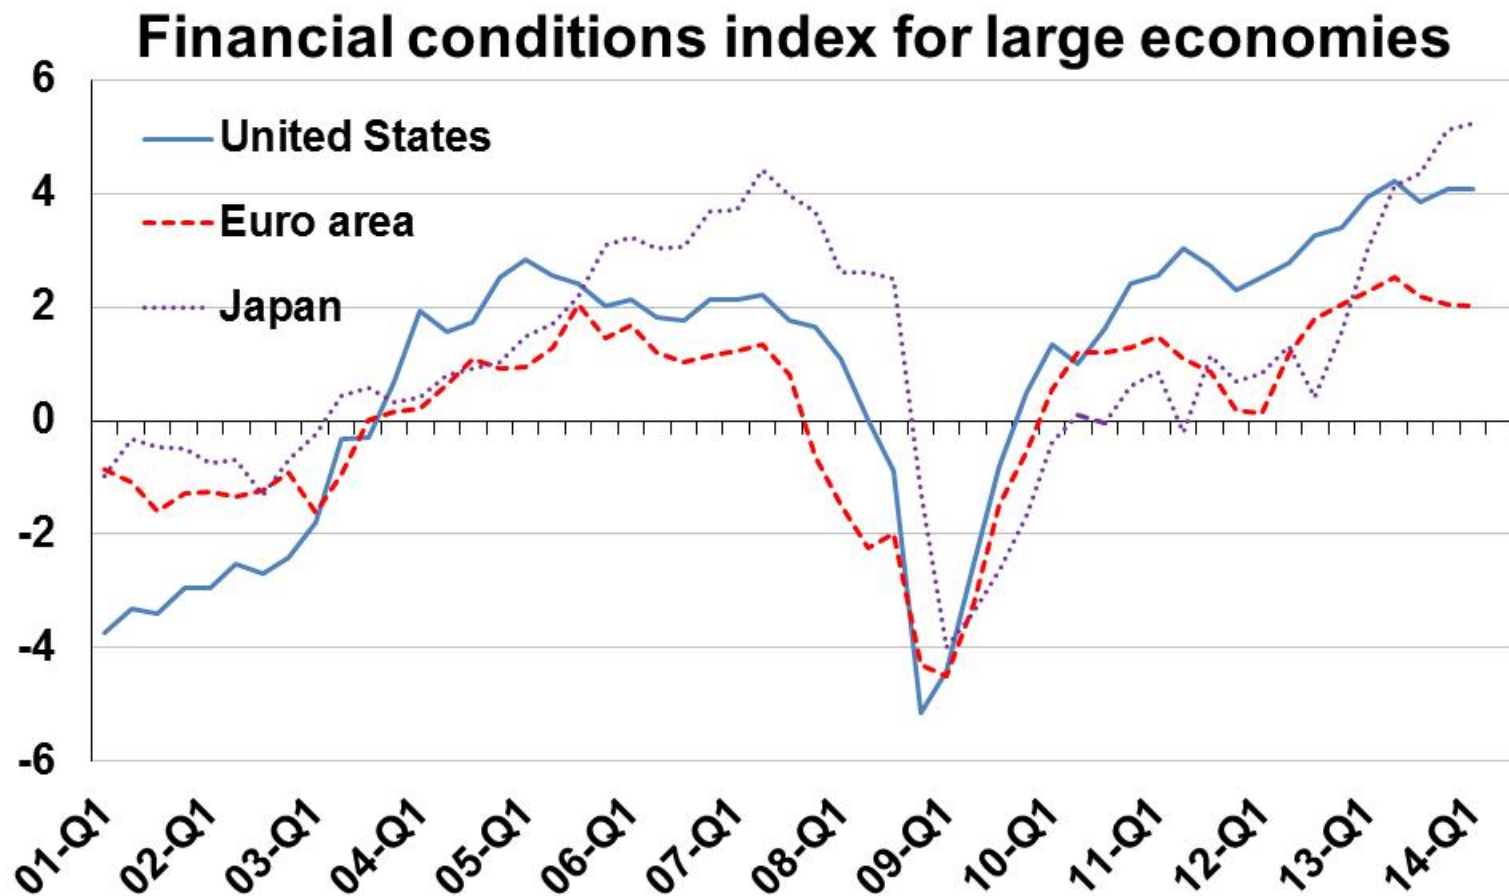

Directional accuracy of May growth projections

OECD countries: 2007-12	Accelerations	Decelerations
Number in period	56	116
% correct: projections for same year	86	88
% correct: projections for next year	91	46

G7 countries: 1982-2006	Accelerations	Decelerations
Number in period	82	78
% correct: projections for same year	79	83
% correct: projections for next year	74	45

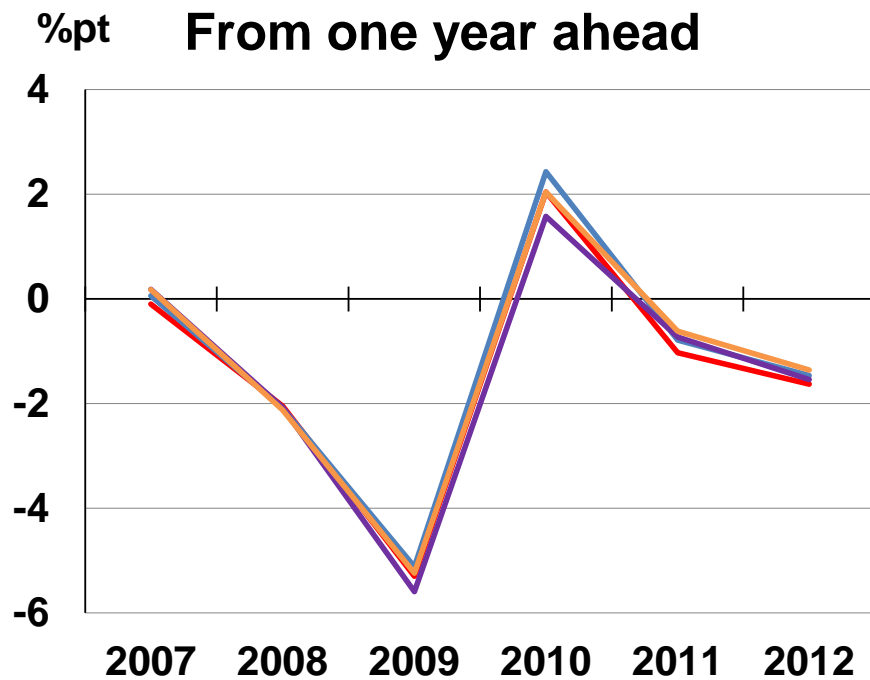

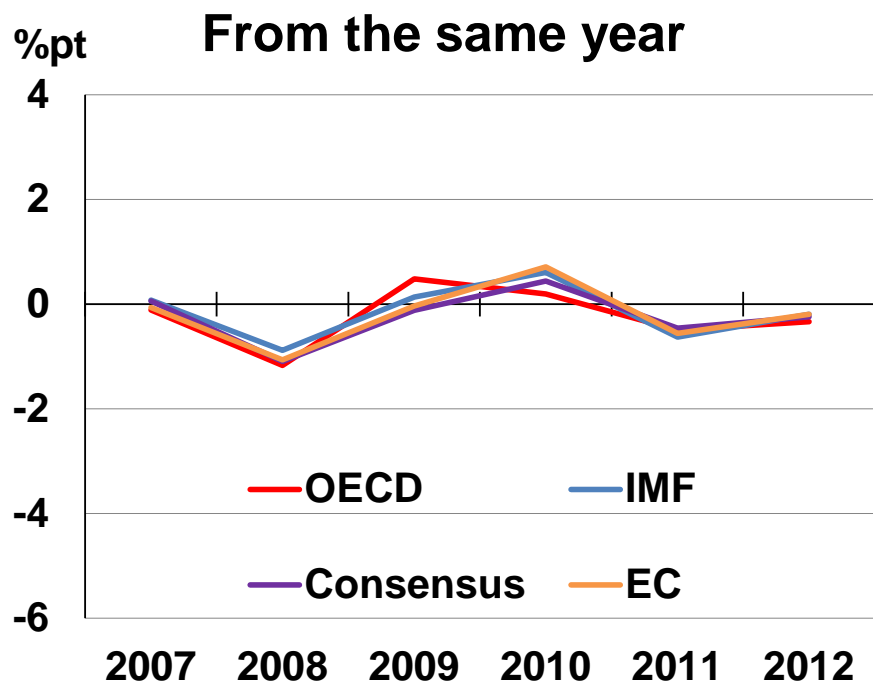

Lesson 2 – include more information on the financial system

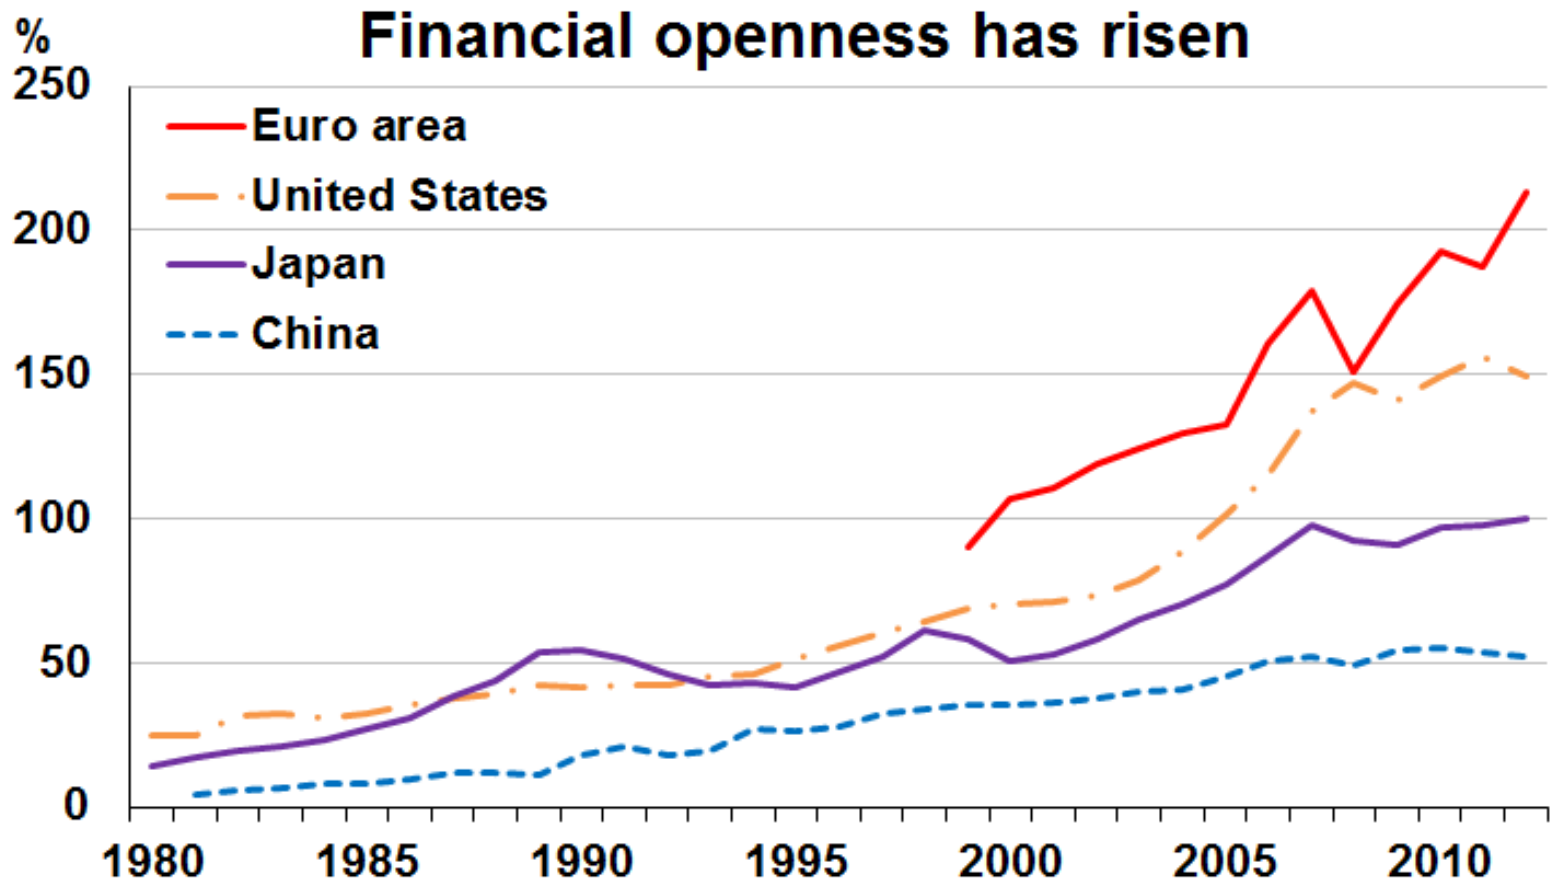

Lesson 3 – avoid “groupthink”

Average errors in forecasts from May - G7 countries

Lesson 4 – better recognise global linkages and spillovers

Financial opennness is the sum of foreign assets and liabilities as a percentage of double GDP.

Lesson 5 – think more about risks

- More information about the risks around the main projections.
- Greater use of quantitative scenario analysis to illustrate possible outcomes.
- Horizon scanning to plan ahead for unlikely but potentially costly events.

Summary

- Forecasting in recent years proved very challenging and growth has been repeatedly over-estimated.
- We can learn from our errors to focus more on global linkages, the financial system and risks.
- There are limits to what forecasts can achieve. Accordingly, as much attention should be paid to the balance of risks as to point forecasts.
