

SF2.4: Share of births outside of marriage

Definitions and methodology

This indicator presents information on the proportion of live births outside of marriage. ‘Births outside of marriage’ are generally defined as births to mothers whose legal marital status at the time of the birth is other than married. This includes births to mothers who are single or who are cohabiting with a partner outside of marriage, births to mothers who are divorced or widowed, births to mothers who are living with a partner in a “common-law” or “de facto” union (unless their legal marital status at the time of birth is also ‘married’), and births to mothers who are living in a civil partnership. For Australia, Japan, Korea, New Zealand and Canada (1960-1973 only), data refer to ex-nuptial/out-of-wedlock births, that is, where the child’s parents are not registered as *married to each other* (or, for New Zealand only, in a civil union with each other) at the time of birth. The ‘proportion of births outside of marriage’ is calculated as the number of births to women whose legal marital status at the time of the birth is other than married [or, for Australia, Japan, Korea, New Zealand and Canada (1960-1973 only), the number of ex-nuptial/out-of-wedlock births], divided by all births in the given year.

Key findings

On average across OECD countries, just under 40% of births occur outside of marriage (Chart SF2.4.A). In five OECD countries (Greece, Israel, Japan, Korea and Turkey) less than 10% of children are born outside of marriage, with rates particularly low – at around 2-3% – in the two East Asian OECD countries (Japan and Korea) plus Turkey. By contrast, in ten others (Belgium, Chile, Denmark, Iceland, Estonia, France, Mexico, Norway, Slovenia, and Sweden) over 50% of children are born outside of marriage. In Chile and Iceland, the rate is as high as around or above two-thirds of births.

Chart SF2.4.A. Share of births outside of marriage, 2014 or latest available year^a
 Proportion (%) of all births where the mother’s marital status at the time of birth is other than married^b

a) Data for Austria, Belgium, Canada, Estonia, France, Iceland, Ireland, the United Kingdom and Cyprus refer to 2012, and for Chile and Norway to 2013

b) Data for Australia, Japan, Korea and New Zealand refer to ex-nuptial/out-of-wedlock births, that is, where the child’s parents are not registered as married to each other (or, for New Zealand only, in a civil union with each other) at the time of the birth. For all other countries, data refer to births to mothers where the mother’s marital status at the time of birth was other than married.

c) For Canada, births to mothers whose marital status is other than married as a proportion of births where the mother’s marital status is recorded. In 2012, the mother’s marital status was not recorded on 10% of births.

Other relevant indicators: Family size and composition (SF1.1); Fertility rates (SF2.1); Mean age of mother at first childbirth (SF2.3); Childlessness (SF2.5); and, Marriage and divorce rates (SF3.1).

d) The statistical data for Israel are supplied by and under the responsibility of the relevant Israeli authorities. The use of such data by the OECD is without prejudice to the status of the Golan Heights, East Jerusalem and Israeli settlements in the West Bank under the terms of international law.

e) For Israel, births to unmarried Jewish women as a proportion of all births to Jewish women, only

f) For Mexico, births to mothers whose marital status is other than married as a proportion of births where the mother's civil status is recorded. In 2014, the mother's civil status was not recorded on 7.4% of births.

g) Footnote by Turkey: The information in this document with reference to « Cyprus » relates to the southern part of the Island. There is no single authority representing both Turkish and Greek Cypriot people on the Island. Turkey recognizes the Turkish Republic of Northern Cyprus (TRNC). Until a lasting and equitable solution is found within the context of United Nations, Turkey shall preserve its position concerning the "Cyprus issue";

h) Footnote by all the European Union Member States of the OECD and the European Commission: The Republic of Cyprus is recognized by all members of the United Nations with the exception of Turkey. The information in this document relates to the area under the effective control of the Government of the Republic of Cyprus.

The proportion of children born outside of marriage has increased in almost all OECD countries (Chart SF2.4.B). In 1970, most OECD countries saw less than 10% of children born outside of marriage, with the average rate across the 27 OECD countries with available data was just 7.5%. By 1995, this OECD-27 average had grown to just over 24%, and by 2014 to as high as 40.5%. In most OECD countries the proportion of children born outside marriage has increased by at least 25 percentage points since 1970, with increases particularly large in Belgium, Norway, and Slovenia. In these three countries, the proportion of children born outside of marriage has increased by almost 50 percentage points since 1970. Of those countries where data are available for all three time points, only Japan and Greece have seen increases of less than 10 percentage points.

Comparability and data issues

Data on the marital status of mothers and/or parents at the time of birth are based on administrative data and reflect only the *legal* marital status of the individuals concerned. Differences across countries and across time in the proportion of children born outside of marriage do not necessarily reflect differences in the proportion of children born to non-partnered mothers, since it is possible for a child to be born to a couple where the mother's legal marital status at the time of birth is other than married (e.g. to a cohabiting couple where the mother's legal marital status is 'single, never married'). In other words, differences across countries and across time in the proportion of children born outside of marriage reflect differences in the propensity of couples to get married prior to parenthood, as well as differences in the proportion of children born outside of two-parent families. In many countries the increase in the share of births outside of marriage is due in large part to an increase in the number of couples cohabiting outside of a legally registered marriage (SF3.3). This is particularly the case in many of the Central and South American countries (e.g. Chile, Mexico) where "free unions" (cohabiting, but not legally married) are increasingly common.

Data on births are collected through administrative sources based upon head counts, and in most countries the legal marital status of the mother and/or the partnership status of parents is recorded for all births. However, in both Canada and Mexico the marital status of parents is not recorded for a certain number of births (in Canada, 10.0% in 2012; in Mexico, 7.4% in 2014). To the extent that those parents whose marital status is not recorded are disproportionately likely to be married or not married, this may have some effect on the share of births classified as outside of marriage in the two countries.
