Between 2009 and 2013, public spending on health fell by EUR 5.2 billion – representing a 32% drop in real-terms. This reduction clearly represents a shock for the system to absorb, even though it is clear that there were inefficiencies in the Greek system (for example, inappropriate prescribing, weak primary care, imbalances in the mix of health professionals). A whole series of changes to entitlement, benefits and user charges as well as structural reforms have left all sectors of the Greek health system affected.

**The health system underwent significant cuts in public spending**

- **Greece has seen a reduction in health spending of more than a third in real terms since 2009**
  
  In 2013, per capita health spending in Greece dropped by a further 3% in real terms - the fourth year in succession that overall health expenditure has fallen. The drop was mainly a result of further decreases in government spending. The government’s annual bill for pharmaceuticals alone was cut by EUR 1.8 billion between 2009 and 2013, notably by cutting the prices paid for drugs and promoting the increased use of generics.

- **The economic crisis significantly reduced health insurance coverage among the population**
  
  Those who were most affected were the long-term unemployed, as well as self-employed workers who decided not to renew their health insurance plan because of reduced disposable income.

Since June 2014, uninsured people are covered for prescribed pharmaceuticals, services in emergency departments in public hospitals, as well as for non-emergency hospital care under certain conditions.

**What can be done?**

- Ensure full implementation of measures aimed to extend coverage and access to the uninsured.
- Increase efforts to improve the long-term sustainability and quality of health care services.
- Further plans to rationalise pharmaceutical spending, and reorganise hospital care.

**Improving preventive health measures**

- **Greece has the highest smoking rate in the OECD with almost one in two men smoking daily**
  
  Tobacco is a major risk factor for at least two of the leading causes of premature mortality – cardiovascular diseases and cancer.

While smoking rates across most OECD countries have shown a marked decline, Greece is the only country that has seen smoking rates increase since 2000. In 2013, nearly 40% of adults in Greece could be considered as daily smokers – twice the OECD average.

**What can be done?**

- Further restrict the promotion of tobacco products, for example, through the introduction of plain packaging.
- Take initiatives to help consumers make informed choices.
- Encourage primary care physicians to counsel at-risk patients about making healthy lifestyle choices.

OECD HEALTH POLICY OVERVIEW

Health policy in Greece

January 2016

www.oecd.org/health

► While adult obesity rates in Greece are around the OECD average, childhood obesity is worryingly high

Children who are overweight or obese are at greater risk of poor health in adolescence, as well as in adulthood. Among young people, orthopaedic problems and psychosocial problems such as low self-image, depression and impaired quality of life can result from being overweight.

Almost one in two boys aged 10-12 in Greece were classed as overweight or obese in 2010. This is the highest in the OECD and almost twice the average.

---

What can be done?

- Develop a comprehensive package of highly effective interventions, targeting younger age groups and the determinants of obesity.
- Provide fiscal incentives, such as increasing the price of food with high fat or sugar content.
- Limit children’s exposure to fast food advertising.
- Provide comprehensive information on food labels to help consumers make informed choices.

Strengthening primary health care

► Current doctor-nurse imbalances imply that the division of tasks in delivering health services is not optimal

Nurses play a critical role in providing health care not only in traditional settings such as hospitals and long-term care institutions but increasingly in primary care (especially in offering care to the chronically ill) and in home care settings. While nurses greatly outnumber physicians in most OECD countries, the opposite is true in Greece, where there are twice as many doctors as nurses.

Greek GPs prescribe more antibiotics than GPs in nearly all other OECD countries

Antibiotics should be prescribed only where there is an evidence-based need, to reduce the risk of resistant strains. The total volume is seen as an indicator of quality in the primary care sector. Greece reports volumes of prescribed antibiotics more than 50% above the average of OECD countries.

What can be done?

- Consider more selective contracting (i.e. select doctors allowed to dispense covered services, based on quality indicators).
- Encourage the training and retention of physicians in primary care settings through the use of incentives.
- Seek to improve appropriateness of care, especially acute care, the balance of services offered in different health care settings, and improve the role of community and primary care.
