

# Changes to the OECD consumer price indices (CPI) series

---

The Consumer Price Indices (CPI) series published by the OECD have been the subject of a recent methodological review to ensure and improve their quality and international comparability across the 31 OECD member countries.

The review process mainly consisted in 1) a survey to collect annual expenditure weights for national CPI for the 31 OECD Member countries at detailed level of the COICOP classification, 2) the creation of an annual CPI weights database and 3) the investigation of the consumer price statistics improvement carried out by the National Statistical Offices (NSO) of OECD member countries.

As a result of this process, the CPI series published on June 25<sup>th</sup> 2010 have been revised for the entire period of the time series following two methodological aspects. The first concerns the statistical method used to calculate comparable CPI series, now based on a “chain-linking system”. The second relates to the definition of the series, which was in some cases revised in order to insure better comparability of the CPI series across OECD member countries.

Furthermore, with the aim to provide users with a better understanding of the changes in CPI series, the CPI weights of the six target CPI series defined below are now available for all OECD countries at the following address<sup>1</sup>: [http://stats.oecd.org/Index.aspx?DataSetCode=MEI\\_CPI\\_WEIGHTS](http://stats.oecd.org/Index.aspx?DataSetCode=MEI_CPI_WEIGHTS)

## Background

The Prices Unit of the OECD Statistics Directorate publishes six CPI series in electronic and paper forms (Main Economic Indicators) defined as CPI target indicators with the aim of compiling comparable CPI data across countries, analytically useful, timely and available for as long as possible.

The six CPI target series have been defined following the COICOP Classification:

1. CPI All items: COICOP 01-12, Individual consumption expenditure of households;
2. CPI Food: COICOP 01, Food and non-alcoholic beverages;
3. CPI Energy: COICOP 04.5, Electricity, gas and other fuels & 07.2.2, Fuels and lubricants for personal transport;
4. CPI All items less food less energy – COICOP 01-12 less COICOP 01. 04.5 & 07.2.2;
5. CPI Housing: COICOP 04.1, Actual rentals for housing, COICOP 04.2, Imputed rentals for housing & COICOP 04.3, Maintenance and repair of the dwelling;
6. CPI Services less housing: Services less COICOP 04.1, Actual rentals for housing, COICOP 04.2, Imputed rentals for housing, & 04.3.2, Services for the maintenance and repair of the dwelling.

23 of the 31 member countries provide the OECD with the component series of the CPI target indicators only<sup>2</sup>. In order to publish comparable series and to calculate zone aggregates<sup>3</sup>, the OECD computes CPI target indicators using weights and component series provided by the NSOs. This is particularly frequent for CPI Energy, CPI All items less Food less energy, CPI Housing and CPI Services less housing series.

So far, the calculations have been done using fixed weights structure provided by the NSOs. The weight reference period was aligned with the index national reference period. This method of aggregation was clearly not optimal especially when prices are subject to large fluctuations (especially for energy) and can lead to severe biases, in particular substitution biases.

- 
1. Except Australia and Korea.
  2. Australia, Austria, Chile, Finland, Iceland, Korea, Turkey and the United States provide directly OECD with the requested CPI target series.
  3. The OECD calculates three area totals (OECD-Total, OECD-Europe and Major Seven Countries) for the four CPI target indicators (All items, Food, Energy, All items less food less energy). Zone totals for CPI are annually chain-linked Laspeyres indices. The weights for each individual link are based on the previous year’s private final consumption expenditure of Households and Non-profit institutions serving households expressed in purchasing power parities (PPP).

## Changes

OECD countries tend to move to an annually updated weighting structure (16 of the 31 OECD member countries) to ensure that the CPI basket is as representative as possible of the consumption patterns of consumers<sup>4</sup>. The other countries update their weighting structure every 2, 3 or 5 years<sup>5</sup>. Within this framework, the OECD has decided to collect annual expenditure weights for national CPI and has changed the way the CPI target series are calculated by using chained linking system<sup>6</sup>.

The second methodological change concerns the definition of the series. A methodological review allowed the OECD to publish CPI series which better match the definitions of CPI target series as defined above.

The changes identified above, and **to be implemented with the May 2010 figures**, will affect a number of series shown in the Main Economic Indicators publication and database. The following tables highlight these series by subject groups, and apply to several countries. Changes will also occur in zone aggregates of the CPIs, especially for CPI Energy and CPI All items less food less energy.

**Table 1: CPI Food, consistent with COICOP 01 - Food and non-alcoholic beverages**

Countries	Series code	Definition following countries' definition	Changes	
			Definition	Calculation
BEL	BEL.CPGDFD02	COICOP 01	New definition	..
CAN	CAN.CPGDFD02	Food purchased from stores	New definition	..
JPN	JPN.CPGDFD02	Food and drink less Alcoholic beverages less Food away from home	..	Chained linking using 5 years weights from January 1996 onwards
NZL	NZL.CPGDFD02	Food groups excluding restaurant meals and ready-to-eat food	..	Chained linking using bi-annual weights from January 2000 onwards

4. The CPI weights are annually updated for France, Hungary, Iceland, Italy, Luxembourg, Netherlands, Norway, Poland, Portugal, Slovak Republic, Spain, Sweden, Switzerland, Turkey, United Kingdom and the United States.

5. CPI weights are updated every 2 years for New Zealand; every 3 years for Denmark; every 4 years for Finland and every 5 years for Austria, Belgium, Canada, Chile, Czech Republic, Germany, Greece, Ireland and Japan.

6. CPI target series are calculated by using annual weights and components series provided by the NSOs. When annual CPI weights are available the chained linked method is apply, otherwise fixed weights (first year available) are used.

**Table 2: CPI Energy, consistent with COICOP 04.5 - Electricity, gas and other fuels & COICOP 07.2.2 - Fuels and lubricants for personal transport**
