

# Fisheries and Aquaculture in Ireland

## January 2021

Globally, fisheries and aquaculture production is an important source of accessible nutritious food, and a basis of livelihoods. It is also a key driver of coastal and rural economic well-being. However, overfishing, illegal fishing and the combined effects of ocean-based activities and climate change on resources and ecosystems put the sector at risk and undermine the resilience of those relying on it in many places. Improving fisheries and aquaculture management is crucial to ensure future generations continue to benefit from Ocean resources and ecosystem services.

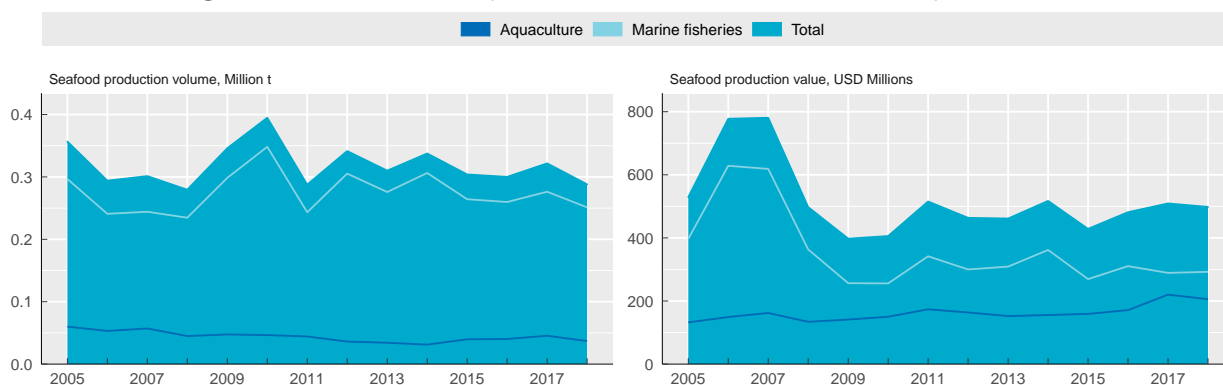

The country notes of the OECD Review of Fisheries 2020 present each country's situation in brief and identify best policy practices and reform pathways. These notes can also inform dialogue on progress towards internationally-adopted goals and targets with respect to sustainable fisheries and aquaculture management and support policies.

## Overview of the sector

### Fisheries and aquaculture production

In 2018, Ireland produced **0.3 million tonnes of fish** (including molluscs and crustaceans), **with a value of USD 498.1 million**. 41% of this value came from aquaculture and 59% from fisheries (that is, the capture of wild resources). Between 2008 and 2018, the quantity produced increased by 3%, while its value unchanged at 0%.

**Figure 1: Fisheries and aquaculture's contribution to seafood production**

Source: FAO dataset 'Global Fishery and Aquaculture Production Statistics' (FishStat.J); OECD dataset 'Marine landings' (OECD.Stat).

Note: Seafood production volume is expressed in live weight tonnes. The value of aquaculture production is estimated based on unit value by live weight tonne, while the value of marine fisheries refers to the value of landings.

## Production and trade in the global context

Ireland is a **net exporter of fish and fish products**. Between 2008 and 2018, **exports** increased by a total of 38%, while **imports** increased by 38%.

**Figure 2: Trade in fish and fish products**

Source: Trade data (UN Comtrade; WITS - World Integrated Trade Solution - the list of commodities included is specified in the OECD dataset 'International trade of fisheries products', OECD.stat) and FAO dataset 'Fishery and Aquaculture Production Statistics' (FishStatJ).

## Employment and fleet

In 2018 **Employment in the seafood sector**, including processing, accounted for **9204 jobs**. This represented 1% less jobs than in 2008. Over the same period, **the average value of production per employee** increased by 18% in marine fisheries and increased by 55% in aquaculture.

In 2018, the **fleet consisted of 2032 powered vessels**, unchanged at 0% since 2008. Small-scale vessels, those below 12 meters in length, accounted for 86.2% of the total number of vessel. The total gross tonnage of the Irish fleet in 2018 was 64455 tonnes, down by 8% since 2008. Small-scale vessels accounted for 9.8% of the total gross tonnage.

## Government support to fisheries

Governments provide support to their fisheries sectors through a wide range of policies. The objectives vary but tend to centre on goals such as maintaining employment, improving fishers' welfare, or ensuring the sustainability of the sector and the resources it relies on. Usually, government finance services to the fisheries sector, which benefit the sector as a whole or some of its segments, and also provide direct support to individuals and companies.

### Financing of services to the fisheries sector

In 2018, Ireland spent EUR 32.2 million (USD 38 million) **financing services to the fisheries sector** while EUR 3.8 million (USD 4.5 million) was recouped via **cost-recovery charges**, that is, fees paid by service users, such as for port access or management, and taxes or fees on resource use and associated profits. Having the sector bear some of the cost of services, reduces the extent to which taxpayers finance it. Net of cost-recovery charges, the **public cost of services to the fisheries sector** amounted to 11.5% of the value of production, while the OECD average was 8.5% in 2018.

The intensity of fisheries services financing relative to fleet size was **USD 589.6 per gross tonne (gt) of total fleet capacity** in 2018. This compares with an OECD average of USD 601.8 per gt in 2018.

**Some services to the sector aim to ensure its sustainability** or improve **fishing communities' well-being**, while only indirectly supporting the intensity of fishing activities. In the OECD, such services, including **management, control and surveillance**, accounted for an average of 59.2% of spending on services to the sector in 2018.

**Other services target fishers' ability to operate** their businesses more efficiently or more sustainably, such as investment in **education and training, marketing and promotion or research and development**. These services accounted for an average of 16% of spending on services to the sector in the OECD in 2018.

Finally, some forms of support **can have a more direct relationship with production capacity**, such as investment in or subsidised access to **infrastructure** like ports. In the OECD, these services have accounted for an average of 24.5% of financing of services to the sector in 2018.

**Figure 5: Financing of services to the fisheries sector, 2018**

Note: Figure uses the latest data reported by Ireland (2018) and OECD average for 2018.

## Direct support to individuals and companies in the fisheries sector

In 2018, Ireland provided support totalling EUR 1 million (USD 1.1 million) through **policies directly benefiting individuals and companies** in the fisheries sector, down by a total of 97% since 2014. This amounted to 0.4% of the value of production.

**A common objective of direct support policies is to maintain or increase the incomes of fishers.** Relative to employment, direct support to individuals and companies decreased by 97% since 2014, reaching USD 368.1 per fisher in 2018.

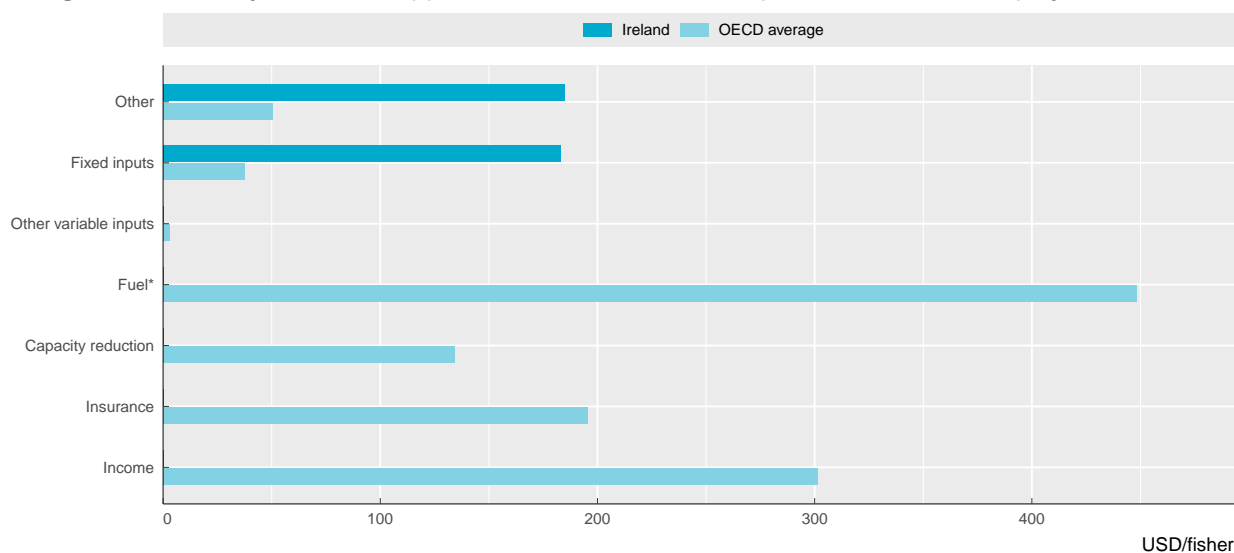

Direct support to individuals or companies originates in a variety of policies. Some **payments can be partially de-coupled from fishing activities**, such as **income** support, special **insurance** systems. Ireland spent USD 0 per fisher on these types of policies in 2018. In the OECD, the average spending per fisher was USD 496.8 in 2018.

Benefits can also be given in exchange for **capacity reduction**, such as through decommissioning schemes or payments for early retirement.

Other **policies are directed at lowering the cost of inputs.** These include **support for fuel**, for **other variable inputs** (like payments to reduce the cost of ice or bait) and for fixed inputs (such as support to vessel construction and modernization or to the purchase of gear). In 2018, Ireland spent **USD 183 per fisher** on **policies lowering the cost of inputs.**

**The impact of support policies varies depending both on the type of policy and the effectiveness of fisheries management.** For example, OECD work has shown that support to fuel is one of the least effective means of transferring income to fishers; while policies lowering the cost of inputs more generally are the most likely to provoke overcapacity, overfishing and illegal, unreported and unregulated (IUU) fishing. OECD analysis has also demonstrated that support policies generally benefit fishers more and are less likely to encourage unsustainable fishing when an effective management system is in place (e.g. when total allowable catch limits are used).

**Figure 6: Intensity of direct support to individuals and companies relative to employment, 2018**

Source: OECD datasets 'Fisheries Support Estimate (FSE)' and 'Employment' (OECD.Stat)

Notes: Figure uses the latest data reported by Ireland (2018) and OECD average for 2018.

\*In the OECD dataset 'Fisheries Support Estimate (FSE)' (OECD.Stat), there are two different types of support to fuel, tax concessions and direct transfers to reduce the cost of fuel. Since impacts are similar, they are jointly considered as support to fuel. Tax concession to fuel are often not specific to fisheries, as the same policies sometimes also apply to other sectors such as agriculture, a number of countries and economies reporting to the FSE database do not include it in their reporting, which affects the relative total support to inputs.

## Fighting illegal, unreported and unregulated (IUU) fishing

IUU fishing harms law-abiding fishers by creating unfair competition and cutting profitability and employment opportunities, while weakening food security in countries that depend on local seafood. IUU fishing also undermines governments' capacity to manage fish stocks sustainably by adding pressure that is difficult to quantify when setting catch limits. It further threatens ecosystems when it makes use of damaging harvest methods and targets species that are already endangered.

Adopting and implementing internationally recognised best policies and practices against IUU fishing is thus key to accelerate the elimination of this serious threat as agreed under SDG 14, which sets the objectives to **end IUU fishing and eliminate subsidies contributing to it by 2020**.

The OECD **IUU policy indicators** investigate the extent to which countries meet their responsibilities in the most important dimensions of government intervention in relation to IUU fishing:

- **Vessel registration**, by which countries collect and publicize information on vessels operating in their exclusive economic zone (EEZ) or flying their flag;
- **Authorisation to operate in the EEZ**, by which countries regulate fishing and fishing-related operations in their EEZ;
- **Authorisation to operate outside the EEZ**, by which countries regulate the operations of vessels flying their flag in areas beyond national jurisdictions and in foreign EEZs;
- **Port measures**, by which countries monitor and control access to and activities at port;
- **Market measures**, by which countries regulate how products enter the market and flow through the supply chain and economically discourage IUU fishing;
- **International co-operation**, by which countries engage in regional and global information sharing and joint activities against IUU fishing.

Ireland performs most strongly in Authorisation to operate outside the EEZ; greatest scope for progress is in the area of Market measures.

**Figure 9: Country's progress in implementing best policies and practices**

Note: Figure uses the latest data reported by Ireland (2018) and OECD average for 2018

## News from Ireland

- In 2018 Ireland produced 0.3 million tonnes of fish with a value of USD 498.1 million, between 2008 and 2018 the quantity produced increased by 3% while its value remained relatively stable.
- Ireland is a net exporter of fish and fish products and between 2008 and 2018 exports and imports increased by 38%.
- The Irish fleet in 2018 totalled 64 455 tonnes a decrease of 8% since 2008.

## For further reading

**The OECD Review of Fisheries 2020** aims to support policy makers and sector stakeholders in their efforts to deliver sustainable and resilient fisheries that can provide jobs, food and livelihoods for future generations. The Review updates and analyses the OECD fisheries support estimate (FSE) database, the most comprehensive, detailed, and consistent collection of country level data on governments support to fisheries. It also presents and analyses newly-assembled data on the health of fish stocks; on the management of key stocks of commercial interest; and on the governance of fisheries across OECD countries and emerging economies with large fishing sectors. The report sheds light on how governments are managing fisheries to minimise detrimental impacts on resources and ecosystems, eliminate illegal, unregulated and unreported (IUU) fishing, while increasing the socio-economic benefits from fishing. It suggests priorities for action both at the national level and for the international community.
