COVID-19 has put unprecedented pressure on local labour markets and economies. The share of jobs in the sectors most at risk from containment measures (e.g. accommodation and food services, and wholesale and retail trade) varies from less than 15% to more than 35% across OECD regions. In Slovenia, disparities between regions are relatively small: the share of jobs in sectors most at risk ranges from 20% in Eastern Slovenia to 24% in Western Slovenia. Both regions had a lower share of jobs at risk than the OECD median region.

While containment measures have restricted economic activity in some sectors, the rapid expansion of teleworking has helped maintain other jobs. The share of jobs amenable to teleworking is close to or above the OECD median region in both of Slovenia’s regions: 32% in Eastern Slovenia and 39% in Western Slovenia.
Local labour market performance prior to COVID-19

Prior to the COVID-19 pandemic, unemployment rates in Slovenia were generally low. Rates varied 0.9 percentage points across regions, from 4% in Western Slovenia to 4.9% in Eastern Slovenia. Looking at the decade following the 2008 crisis, both regions had unemployment rates higher in 2018 than in 2008, a pattern seen in less than one-third of OECD countries. Regional gaps in unemployment also shrank over this period, but because of worsening performance in the best performing region. The unemployment rate increased by 1.3 percentage points in Western Slovenia, which had the lower unemployment rate in 2008, while it increased by only 0.2 percentage points in Eastern Slovenia, which had the higher rate in 2008.

In Eastern Slovenia, the number of people employed decreased between 2008 and 2018, while in Western Slovenia, it stayed relatively stable. In 2018, Eastern Slovenia accounted for over half (52%) of all employment in Slovenia, while Western Slovenia accounted for over half (54%) of all high-skill employment. Looking at a longer time period (2000-2018), the geographic concentration of jobs, including high-skill jobs, (as measured by the number of people employed) did not change significantly in Slovenia.
COVID-19 will likely accelerate automation, putting additional pressures on places with relatively high shares of jobs at risk. Both regions in Slovenia have a higher share of jobs at high risk or risk of significant change from automation than the OECD median region. The share of jobs at risk ranges from 51% in Western Slovenia to 56% in Eastern Slovenia.

Following general OECD patterns, in Slovenia, both regions saw the share of middle-skill jobs decrease between 2000 and 2018. The share of middle-skill jobs decreased by 13 and 15 percentage points in Western Slovenia and Eastern Slovenia respectively. This represents a net decrease of over 35,000 and 63,000 middle-skill jobs respectively. In both regions, decreasing shares of middle-skill jobs were predominantly offset by increasing shares of high-skill jobs.
Active labour market policies will be of growing importance as the COVID-19 response moves from emergency supports to facilitating labour market transitions. The institutional arrangements for these policies, and the role of subnational governments, varies significantly across countries.

<td>The Employment Service of Slovenia (ESS), which is under the Ministry of Labour, Family, Social Affairs and Equal Opportunities, is responsible for delivering most active labour market policies in Slovenia. Twelve regional offices are responsible for the implementation of tasks related to monitoring labour market trends at the local level, and supporting local offices in their co-operation with employers and ESS sub-contractors. The local offices are the direct link between the ESS and the clients and implement the policies of ESS (e.g. employment counselling, providing insurance for unemployment, and implementing employment policies).</td>
