

Czech Republic

The Czech GDP per capita has resumed convergence towards the OECD average in recent years. The Czech GDP per capita stood about a fifth below the OECD average in 2016. Stagnating labour productivity hampered convergence between 2008 and 2013. The employment rate has increased significantly and by the end of 2017 was well above the OECD average. Hours worked are just above the OECD average.

A middle-income country with high employment

CZECH REPUBLIC	Pre-crisis 2003-08	Post-crisis 2011-16
<i>Levels</i>		
GDP per capita**	25819 (33712)*	28809 (35776)*
GDP per hour worked**	29.5 (41.6)*	33.3 (45.6)*
Employment rate, %	65.3 (66.4)*	68.5 (66.8)*
<i>Average annual growth rate</i>		
GDP per capita	4.8 (2.8)*	1.7 (1.4)*
GDP per hour worked	4.0 (2.0)*	1.3 (1.1)*
Employment	1.1 (1.6)*	0.8 (1.0)*
Median household disposable income***		1.3 (1.4)*

Notes: * Unweighted OECD average in brackets.

** USD, constant 2010 PPPs and constant prices.

*** Data refer to 2011-15 and are deflated by the consumer price index.

The Czech Republic is one of the most open economies in the OECD, with a strong participation in GVCs. The Czech Republic is one of the OECD countries most highly integrated in GVCs, with almost half of Czech domestic value added embodied in foreign final demand and one of the highest import content of exports (47%). Such integration has been supported by trade and investment policies. Regulatory restrictions to FDI are among the lowest. Inward FDI as a share of GDP is higher than in most OECD countries. As a result, foreign-owned firms account for over one quarter jobs in the private sector and 40% of the value added. EU common customs tariffs applied to goods imports from outside the EU are regarded as low on average and restrictions on trade in services are low, with engineering services being the only sector out of 21 with higher barriers than the OECD average. Air transport is the sector where restrictions are the highest, reflecting notably foreign equity restrictions associated with the common EU regulation on air services. The reliance of goods exports on services inputs is not particularly high compared to other OECD, with the latter accounting for close to 50% of exports in value added terms. Services also account for almost 60% of GDP and a slightly higher share of employment.

A very open economy, highly engaged in GVCs

Income inequality is low but employment and gender gaps are high. The share of national income accruing to low income groups is among the highest in the OECD, supported by a highly redistributive tax and transfer system which reduces about market income inequality by almost a half. However, despite an increase over the past decade, employment rates of the traditionally disadvantaged groups – mothers with young children, immigrants, youth, disabled or older workers - remain much lower than those of prime-age males. Labour market outcomes for people of Roma ethnicity also lag behind. Education outcomes are less dependent on being an immigrant than in other OECD countries, but much more highly linked to students’ socio-economic background and the integration of Roma children is a challenge. Employment rates of women, especially those with children under age of 6, remain much lower than men’s due notably to relatively limited access to affordable early childhood education and child care facilities and a lack of flexible working arrangements. Moreover, women who are employed work almost as long hours as men, but earn significantly less (16.3% for full time employees).

Inequality in income low but access to employment is very unequal

 METADATA ANNEX

Economic openness

- **Trade exposure** is defined as exports and imports over GDP.
- **The share of domestic value added embodied in foreign final demand** is defined as domestic value added, from industry, meeting foreign final demand, as a percentage of industry value added. It can be considered as a measure of an industry's reliance on foreign final demand. Here, the denominator is value added adjusted to be consistent with final demand (both domestic and foreign).
- **Foreign Direct Investment stocks** are defined as the total level of direct investment at a given point in time, usually the end of a quarter or of a year. The outward FDI stock is the value of the resident investors' equity in and net loans to enterprises in foreign economies. The inward FDI stock is the value of foreign investors' equity in and net loans to enterprises resident in the reporting economy. For the Netherlands, FDI stock data exclude positions to and from resident Special Purpose Entities (SPEs); SPEs are entities whose role is to facilitate the internal financing of the MNE but that have little or no physical presence in an economy. Excluding such entities from the FDI statistics provides a better measure of the FDI of the country that is having a real impact on its economy.

Trade and FDI

- **The Services Trade Restrictiveness Index (STRI)** identifies which policy measures restrict trade. It provides policy makers information and measurement tools to improve domestic policy environment, negotiate international agreements and open up international trade in services. It can also help governments identify best practice and then focus their domestic reform efforts on priority sectors and measures. The index presented is a geometric average of all sectors and takes value from 0 to 1, where 0 is completely open and 1 is completely closed.
Data are missing for Argentina and Peru.
- **Trade facilitation indicators (TFIs)** identify areas for action and enable the potential impact of reforms to be assessed and help governments to improve their border procedures, reduce trade costs, boost trade flows and reap greater benefits from international trade. The index takes values from 0-2 (least to best performance). The index presented is a simple average over 11 dimensions of the TFI.
Data are missing for Iceland.
- **The FDI regulatory Restrictiveness Index** is gauging the restrictiveness of a country's foreign direct investment rules by looking at four main types of restrictions: foreign equity restrictions, discriminatory screening or approval mechanisms, restrictions on key foreign personnel and operational restrictions. Implementation issues are not addressed and factors such as the degree of transparency or discretion in granting approvals are not taken into account. The index takes values between 0 for open and 1 for closed.

Inequality

- **The share of national disposable income held by the poorest 20% and 40%** is defined as the share of income that accrues to subgroups of population indicated by deciles or quintiles.
For the poorest 20%, data refer to 2014 for Argentina, Germany, Hungary, Luxembourg; 2012 for Japan.
- **The employment gap for disadvantaged groups** is expressed as a percentage of the benchmark group (prime-age male workers). Disadvantaged groups include mothers with young children, youth (15-19 years old) excluding those in full-time education or training, older workers (55-64 years old), non-natives and people with disabilities.
Data are missing for Colombia and Costa Rica in 2006 and for Peru in 2006 and 2016.
- **The gender gap in employment rates** is defined as the difference between employment to population ratios of men and women aged 15-64.
Data refer to 2010 and 2014 for Argentina.

Redistribution, activation and inequality of opportunities

- **The redistribution of the tax and transfers system** is measured as the difference between pre-tax and transfer and post-tax and transfers Gini coefficients, relative to the pre-tax and transfer Gini coefficient. The Gini coefficient measures the extent to which the distribution of income (or, in some cases, consumption expenditure) among individuals or households within an economy deviates from a perfectly equal distribution. The coefficient takes the value of 0 in the case of perfect equality and 100 for perfect inequality.
Data refer to 2014 for Germany, Hungary, Luxembourg and Peru; 2012 for Japan. Data are missing for Argentina and Colombia.
- **Public expenditure on active labour market policies per unemployed** are measured by all social expenditure (other than education) which is aimed at the improvement of the beneficiaries' prospect of finding gainful employment or to otherwise increase their earnings capacity. It includes spending on public employment services and administration, labour market training, special programmes for youth when in transition from school to work, labour market programmes to provide or promote employment for unemployed and other persons (excluding young and disabled persons) and special programmes for the disabled. Data are expressed as a percentage of GDP per capita. Original data can be accessed under: <http://stats.oecd.org/Index.aspx?DataSetCode=LMPEXP>. *Data are missing for Argentina, Colombia, Costa Rica and Peru. For Canada, data include federal expenditures on programmes implemented by the provinces and territories, but do not generally include the provinces' and territories' additional or complementary funding of these programmes.*
- **Differences in PISA mean scores (average of mathematics and science) between natives and first and second generations of immigrants.** PISA assesses the extent to which 15-year-old students, near the end of their compulsory education, have acquired key knowledge and skills that are essential for full participation in modern societies
Data are missing for Japan, Poland and Peru. For Argentina, data refer to the region of the capital city of Buenos Aires.
- **The variance of educational achievement** is measured as the total variance in PISA scores in reading, mathematics and science, compared to the OECD (OECD=100). The Programme for International Student Assessment (PISA) assesses the extent to which 15-year-old students, near the end of their compulsory education, have acquired key knowledge and skills that are essential for full participation in modern societies. The variance components in mathematics, sciences and reading were estimated for all students in participating countries with data on socio-economic background and study programmes. The variance in student performance is calculated as the square of the standard deviation of PISA scores in reading, mathematics and science for the sample of students used in the analysis.
For France, average of PISA scores in mathematics and reading only in 2015. For Argentina, data refer to the region of the capital city of Buenos Aires.
