

OBESITY AND THE ECONOMICS OF PREVENTION: FIT NOT FAT

KEY FACTS – HUNGARY, UPDATE 2012

1. Adult obesity rates in Hungary are amongst the highest in the OECD area, as well as child overweight. More than 1 in 2 people are overweight, and 1 in 5 people are obese in Hungary. One in 4 children aged 13 to 14 are overweight.

2. Taking account of the most recent data, new projection bands for 2010-2020 indicate that obesity rates are expected to stabilize whereas future overweight rates are uncertain.

3. More men than women are overweight in Hungary, but large social disparities exist in women. Women with poor education are 1.7 times as likely as more educated women to be overweight, but this gap is not present in men. The degree of socio-economic inequality has remained virtually unchanged in recent years.

Released: 21 February 2012.
