

# Embracing a One Health Framework to Fight Antimicrobial Resistance

Estonia

Antimicrobial resistance (AMR) – the ability of microbes to resist antimicrobials - remains an alarming global health threat that jeopardises the effectiveness of many 20th century public health advances. The latest OECD analysis shows that across 34 OECD and EU/EEA countries, AMR is estimated to claim more than 79 thousand lives every year, with the annual costs to health systems nearing USD PPP 29 billion. Adopting a multisectoral approach called the One Health framework is vital to tackling the complex drivers of AMR across human health, animal health, agrifood systems and the environment.

In recent years, Estonia made important strides in tackling AMR. Yet, more progress is needed:

**Resistance proportions** for 12 antibiotic-bacterium pairs decreased slightly between 2005 and 2019 (13.1% vs 11.3%) and averaged below the EU/EEA average (21.3% in 2019). If left unchecked, resistance proportions are projected to increase slightly to 12% by 2035, averaging below the expected EU/EEA average (20.3%).

Without further policy action, resistance proportions for carbapenem-resistant *Pseudomonas aeruginosa* and third-generation cephalosporin-resistant *Klebsiella pneumoniae* are expected to grow at the fastest pace between 2019 and 2035 (7.1 and 2.8 percentage points respectively). Growing resistance in these antibiotic-bacterium pairs can undermine the treatment of illnesses such as diarrhea, urinary tract infections, pneumonia and bloodstream infections.

**Total antibiotic consumption in human health** averaged at 11.7 defined daily dose (DDD) per 1 000 persons per day in 2015, below the EU/EEA average (24.1). If trends persist, total antibiotic consumption is expected to decrease slightly to 13.4 DDD per 1 000 persons per day by 2030, remaining below the projected EU/EEA average (23.2).

**Access antibiotics** – first- and second-line therapies with lower resistance potential – made up nearly 58% of all antibiotics consumed in Estonia in 2015, remaining below the WHO target for Access antibiotics to make up at least 60% of national consumption.

## AMR continues to pose a worrisome threat to population health and healthcare budget in Estonia:

Note: The impact of AMR on population health is modelled by the OECD using two scenarios: 1) Elimination Scenario and 2) Replacement Scenario. The Elimination Scenario assumes elimination of all the resistant infections whereas the Replacement Scenario considers a situation where all resistant infections are assumed to be completely replaced by susceptible infections. Both scenarios are seen as plausible due to the dearth of concluding evidence in the literature.

## Estonia performs well in some policy areas but there is room for further policy action:

### National AMR Action Plan

### Optimising antimicrobial use in human health

### Monitoring antimicrobial consumption in human health

### Infection prevention and control (IPC) in human health

### Training and education on AMR in human health

### Biosecurity practices in terrestrial animal production

### Good management and hygiene practices in food processing

The following priorities for action are identified to align policies with the *Global Action Plan to Tackle AMR*:

- **Advancing in the AMR agenda** by incorporating the financial provisions for the implementation of the AMR action plan into the national action plans and budgets.
- **Optimising antimicrobial use in human health** to ensure national guidelines are implemented and data on antimicrobial use is systematically fed back to prescribers.
- **Improving IPC in human health** to ensure a) functional national and health facility level best practices are systematically in place b) compliance and effectiveness are assessed and c) guidance is regularly updated.
- **Enhancing monitoring and evaluation arrangements** to ensure adoption of and compliance with antimicrobial stewardship and IPC programmes in **long-term care facilities**.
- **Improving biosecurity practices** by a) implementing a nationwide plan to ensure good animal husbandry and biosecurity best practices and b) implementation is regularly assessed.
- **Improving good management and hygiene practices** in food processing by a) implementing a nationwide plan to promote best practices in manufacturing and hygiene and b) implementation is regularly assessed.

Notes: 1- least developed; 5 – most developed; diamonds indicate mode for OECD and EU/EEA countries; country scores are denoted in light blue.

**The One Health approach underscores the importance of pairing policies across sectors. The OECD examined the impact of different policies including a mixed policy package that would involve the scaling-up of 5 policy priorities across sectors.**

Improve antibiotic stewardship

Improve hand hygiene practices in healthcare settings

Delayed antimicrobial prescription

Increase mass media campaigns

Enhance food safety

**In Estonia, investing 2 EURs per person annually in a mixed policy package can yield important gains every year:**

Infections prevented

1 154

Lives saved

15

Savings in healthcare costs (in million EURs)

1.5

Gains by increased workforce participation and productivity (in million EURs)

2.4

Return per EUR invested
