

# TECHNOLOGY AND THE FUTURE OF WORK

Source: International Federation of Robotics (IFR).

Orders of industrial robots have tripled over last decade and are projected\* to increase rapidly.

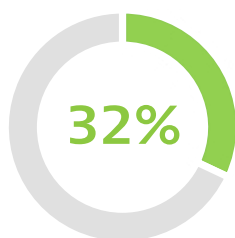

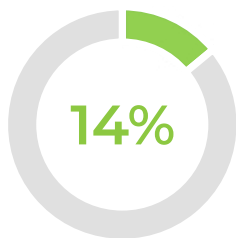

**Will this lead to fewer jobs for humans? Unlikely.** While technological progress makes some occupations obsolete, it also creates new jobs.

Between 1995 and 2015 employment in the manufacturing sector went down 20%, while it went up by 27% in the service sector.

**Overall, employment has been rising,** helped mainly by a larger share of women and older people in work.

But in the future **14% of jobs could be automated**, with many more significantly changing.

Completely automated    Change significantly
