

Embracing a One Health Framework to Fight Antimicrobial Resistance

Japan

Antimicrobial resistance (AMR) – the ability of microbes to resist antimicrobials - remains an alarming global health threat that jeopardises the effectiveness of many 20th century public health advances. The latest OECD analysis shows that across 34 OECD and EU/EEA countries, AMR is estimated to claim more than 79 thousand lives every year, with the annual costs to health systems nearing USD PPP 29 billion. Adopting a multisectoral approach called the One Health framework is vital to tackling the complex drivers of AMR across human health, animal health, agrifood systems and the environment.

In recent years, Japan made important strides in tackling AMR. Yet, more progress is needed:

Resistance proportions for 12 antibiotic-bacterium pairs decreased slightly between 2005 and 2019 (15.2% vs 14.7%) but averaged below the OECD average (20.8% in 2019). If left unchecked, resistance proportions are projected to increase slightly to 15.3% by 2035, averaging below the expected OECD average (20%).

Without further policy action, resistance proportions for carbapenem-resistant *Acinetobacter baumannii* and carbapenem-resistant *Pseudomonas aeruginosa* are expected to grow at the fastest pace between 2019 and 2035 (4.6 and 2.9 percentage points respectively). Growing resistance in these antibiotic-bacterium pairs can undermine the treatment of illnesses such as bloodstream infections, urinary tract infections and pneumonia.

Total antibiotic consumption in human health averaged at 14.5 defined daily dose (DDD) per 1 000 persons per day in 2015, below the OECD average (23.3). If trends persist, total antibiotic consumption is expected to increase to 17.3 DDD per 1 000 persons per day by 2030, remaining below the projected OECD average (22.5).

Access antibiotics – first- and second-line therapies with lower resistance potential – made up nearly 14% of all antibiotics consumed in Japan in 2015, remaining below the WHO target for Access antibiotics to make up at least 60% of national consumption.

AMR continues to pose a worrisome threat to population health and healthcare budget in Japan:

■ Elimination scenario

■ Replacement scenario

Deaths per 100 000 persons

Annual per capita health expenditure JPY PPP

Unless resistant infections are eliminated, AMR is estimated to claim the lives of more than 8 138 persons each year.

AMR can cost around JPY 318 billion annually unless resistant infections are eliminated.

Note: The impact of AMR on population health is modelled by the OECD using two scenarios: 1) Elimination Scenario and 2) Replacement Scenario. The Elimination Scenario assumes elimination of all the resistant infections whereas the Replacement Scenario considers a situation where all resistant infections are assumed to be completely replaced by susceptible infections. Both scenarios are seen as plausible due to the dearth of concluding evidence in the literature.

Japan performs well in most policy areas but there is room for further policy action:

National AMR Action Plan

Optimising antimicrobial use in human health

Monitoring antimicrobial consumption in human health

Infection prevention and control (IPC) in human health

Training and education on AMR in human health

Biosecurity practices in terrestrial animal production

Good management and hygiene practices in food processing

The following priorities for action are identified to align policies with the *Global Action Plan to Tackle AMR*:

- **Optimising antimicrobial use in human health** to ensure national guidelines are implemented and data on antimicrobial use is systematically fed back to prescribers.
- **Improving good management and hygiene practices** in food processing by a) implementing a nationwide plan to promote best practices in manufacturing and hygiene and b) implementation is regularly assessed.

Notes: 1- least developed; 5 – most developed; diamonds indicate mode for OECD and EU/EEA countries; country scores are denoted in light blue.
Source: 2021-22 Tripartite AMR Self-Assessment Survey

The One Health approach underscores the importance of pairing policies across sectors. The OECD examined the impact of different policies including a mixed policy package that would involve the scaling-up of 5 policy priorities across sectors.

Improve antibiotic stewardship

Improve hand hygiene practices in healthcare settings

Delayed antimicrobial prescription

Increase mass media campaigns

Enhance food safety

In Japan, investing 814 JPYs per person annually in a mixed policy package can yield important gains every year:

Infections prevented

111 877

Lives saved

2 926

Savings in healthcare costs (in billion JPYs)

84

Gains by increased workforce participation and productivity (in billion JPYs)

110

Return per JPY invested
