21st-century readers: Developing literacy skills in a digital world

The Programme for International Student Assessment (PISA) is a triennial survey of 15-year-old students around the world that assesses the extent to which they have acquired the key knowledge and skills essential for full participation in societies. The assessment in 2018 focuses on reading, mathematics, science and the innovative domain of global competence. Reading was the main subject assessed in PISA 2018, and the reading framework was devised to include essential reading skills in a digital world.

The thematic report 21st-century readers: Developing literacy skills in a digital world provides important insights into how 15-year-old students are developing reading skills that help them navigate through information in a technology-rich 21st century. This report focuses on policies and practices that can harness digitalisation to create better learning opportunities. It also looks at ways to counter digitalisation’s disruptive effects in and for education.

France

Summary of key findings

- In PISA 2018, having a strictly focused navigation and being able to actively explore single- and multiple-source items were strongly correlated with knowledge of effective reading strategies and reading performance. In France, almost one in every three students showed these navigation behaviours.

- Among OECD countries, students in France scored in the second quartile in the index of knowledge of reading strategies for assessing the credibility of sources. The socio-economic gap for this index, the difference between advantaged and disadvantaged students, also ranked in the second quartile among OECD countries.

- Similar to the OECD average, two thirds of the gender performance gap in reading in France can be accounted for by the differences between boys’ and girls’ knowledge of effective reading strategies (i.e understanding and memorising a text, summarising information, and assessing the credibility of sources).

- The index of enjoyment of reading decreased in France between 2009 and 2018 by around twice the OECD average, namely around 0.14 of a standard deviation. Girls tend to enjoy reading more than boys, and this gender gap is similar to the OECD average. However, the socio-economic gap in reading enjoyment in France was the largest with Finland, Germany, Singapore, and Switzerland among all participating countries and economies in PISA 2018.

- Compared to students who rarely or never read books, print-book readers in France scored 54 points more in reading (OECD average: 49 points); digital-book readers scored 18 points more
(OECD average: 15 points); and students who balance print and digital reading scored 46 points more (OECD average: 37 points) after accounting for students’ and schools’ socio-economic profile, and students’ gender.

- In PISA 2018, the relationship between reading performance and time spent using digital devices for schoolwork was negative in 36 countries and economies after accounting for students and schools’ socio-economic status. In France, the change in reading performance associated with an one-hour increase in the total time a week using digital devices for school is -10 points (OECD average: -7 points), after accounting for students’ and schools’ socio-economic status.

### Digital divide

- In France, 90% of students (OECD average-31: 89%) had both a connection to the Internet at home and a computer they could use for schoolwork in PISA 2018. This was 35 percentage points more than in PISA 2003 (OECD average-31: 28 percentage points more).

- In France, some 81% (OECD average: 79%) of students attending disadvantaged schools\(^1\) compared to 96% (OECD average: 94%) of students attending advantaged schools reported having access to the Internet and a computer they can use for schoolwork at home. In Denmark, Iceland and Poland, over 95% of students attending disadvantaged schools report that they had a computer linked to the Internet for doing schoolwork at home. In contrast, this percentage is lower than 20% in Indonesia, Mexico, Morocco, Panama, Peru, the Philippines, and Viet Nam.

### Opportunity to learn

- In France, 50% of students reported being trained at school on how to recognise whether online information is biased (OECD average: 54%). More than 75% of students had access to this school training in Albania, Singapore and the United States. However, less than 40% of students did so in Argentina, Brunei Darussalam, Costa Rica, Latvia, Morocco and Viet Nam.

- The percentage difference between students from advantaged\(^2\) and disadvantaged backgrounds who were taught how to detect biased information on the Internet was 7 percentage points in favour of advantaged students in France, comparable to 8 percentage points on average in OECD countries. Among OECD countries, there is no significant difference in the Czech Republic, Greece, Israel, Lithuania, Poland, and the Slovak Republic.

- Education systems with a higher proportion of students who were taught digital skills in school and who have digital access at home were more likely to correctly distinguish fact from opinion in the PISA reading assessment even after accounting for country per capita GDP. In France, the PISA reading released item of distinguishing fact from opinion was estimated to be 37% correct\(^3\), below the OECD average of 47%.

### Navigating digital environments

- On average across OECD countries, 19% of students reported feeling lost in the PISA test when navigating through different pages. In France, 23% of students reported these difficulties, while less than 15% of students reported these difficulties in Germany, Beijing, Shanghai, Jiangsu and Zhejiang (China) (hereafter “B-S-J-Z [China]”), Belarus, Denmark, Finland, Hungary, Ireland, Italy, Lithuania, the Russian Federation, and Spain. On the other hand, around 50% of students reported feeling lost in the PISA test in Indonesia, the Philippines, and Thailand.
In France, approximately 29% of students followed item instructions in the PISA reading assessment by carefully selecting pages relevant to the tasks and limiting visits to irrelevant pages (strictly focused navigation) and actively navigating both single- and multiple-source items (actively explorative navigation). These navigation behaviours were strongly correlated with knowledge of effective reading strategies and reading performance. In comparison, more than half of the students showed those navigation behaviours in B-S-J-Z (China), Hong Kong (China), Korea, Singapore and Chinese Taipei, and at least 40% in Canada, Japan, Macao (China), New Zealand, the United Kingdom, and the United States.

In the index of knowledge of reading strategies for assessing the credibility of sources, students in France scored in the second quartile (0.07 points) among OECD countries, while students in Denmark, Germany, Ireland, Japan, the Netherlands, and the United Kingdom scored the highest (higher than 0.20 points). Students in Germany, Luxembourg, Portugal, Switzerland and the United States, reported the largest socio-economic gap (0.65 points or higher) in this index of knowledge of strategies for assessing the credibility of sources. For French students, this socio-economic gap (0.41 points) ranked in the second quartile among OECD countries.

Strategies to tackle inequality and gender gaps

In France, students scored above the OECD average in reading (493, OECD average: 487) but reported a higher than OECD average perception of difficulty of the PISA reading assessment (0.13). As in 69 other countries/economies, disadvantaged students in France perceived the PISA reading assessment as more difficult than advantaged students, even after accounting for students’ reading scores. This perception-of-difficulty gap between advantaged and disadvantaged students was the largest in B-S-J-Z (China), Luxembourg, and Singapore – close to a half standard deviation after accounting for reading performance (approximately -0.50). This gap in France was -0.33 (OECD average: -0.22).

On average across OECD countries and after accounting for students’ socio-economic backgrounds, more boys reported feeling that the PISA reading test was easier than girls, even though boys scored 25 points lower than girls in reading. In France, boys and girls did not report significantly different levels of perceived difficulty for the PISA reading test on average, even though boys scored 17 points lower than girls in reading after accounting for students’ socio-economic backgrounds.

In France, 26% (OECD average: 29%) of the association between socio-economic background and reading performance can be accounted for by the difference between socio-economically advantaged and disadvantaged students’ reported self-perception of reading competence.

Similar to the OECD average, two thirds of the gender performance gap in reading in France can be accounted for by the difference between boys’ and girls’ knowledge of effective reading strategies (i.e. understanding and memorising a text, summarising information, and assessing the credibility of sources).

Print reading in a digital world

Compared to students who rarely or never read books, print-book readers in France scored 54 points more in reading (OECD average: 49 points); digital-book readers scored 18 points more (OECD average: 15 points); and students who balance print and digital reading scored 46 points more (OECD average: 37 points) after accounting for students’ and schools’ socio-economic profile, and students’ gender.

Compared to students who rarely or never read books, print-book readers in France read about 4 hours more a week (OECD average: 4 hours); digital-book readers read almost 4 hours more a week
(OECD average: 3 hours); and those who balance both formats read about 6 hours more a week after accounting for students’ and schools’ socio-economic background and students’ gender (OECD average: 5 hours).

- The index of enjoyment of reading decreased between 2009 and 2018 on average across OECD countries (-0.06), and in one-third of countries and economies with available data on this index. In France, the decrease in the index of enjoyment of reading (-0.14) was around twice the OECD average change over the last decade.

- Girls and students from a higher socio-economic background typically report higher levels of enjoyment of reading. In France, the gap between boys and girls in the index of reading enjoyment was 0.56 points, similar to the OECD average of 0.60 points. However, the gap between disadvantaged and advantaged students was almost two thirds of a standard deviation, among the largest with Germany, Finland, Singapore, and Switzerland.

Figure 1. Average time of reading for enjoyment by the format of reading

Difference between students who read books in the following way and those who "rarely or never read books", after accounting for students' and schools' socio-economic profile, and students' gender

Teachers’ practices

- Disadvantaged students and boys – who typically have a lower reading performance - perceived less stimulation from their teachers in reading activities in 49 countries/economies participating in PISA 2018. In France, girls perceived more stimulation in reading from their teachers than boys did (0.08), around the OECD average (0.07). However, no significant difference was reported between disadvantaged and advantaged students in their perception of teachers’ stimulation of reading engagement. In France, girls scored 25 points more than boys in reading (OECD average: 30 points), and advantaged students 107 points more than disadvantaged students (OECD average: 88).

- The association between teachers’ stimulation of reading engagement and students’ enjoyment of reading is positive in all participating countries and economies in PISA 2018. It is positive, as well, with reading performance in 61 countries and economies after accounting for students' and schools' socio-economic profile. France is one of the 14 countries and economies – out of 77 with available data in this index – in which teachers’ stimulation of reading engagement is not associated with reading performance.
• Reading fiction texts and reading long texts for school more frequently was positively associated with reading performance in most countries/economies after accounting for students’ and schools’ socio-economic profile. In France however, students who reported reading fiction books two or more times during the last month did not score differently than students who did not, after accounting for students’ and schools' socio-economic profile (OECD average: 9 points). Students who had to read longer pieces of texts for school (101 pages or more) achieved 46 points more in reading than those who reported reading smaller pieces of text (10 pages or less) after accounting for students’ and schools’ socio-economic profiles and students’ gender (OECD average: 31).

• The average duration of time per week students spent using digital devices during classroom lessons and outside of the classroom for language lessons across OECD countries was 41 minutes. Students in Australia, New Zealand, Sweden and the United States reported spending more than 1 hour a week, and students in Denmark reported about 2 hours a week. In France, students reported spending 27 minutes a week. France, Germany, Ireland, Japan, and Korea, had the lowest share of students reporting that during the last month both the teacher and students used a digital device for learning and teaching during test language lessons: 24% or less (OECD average: 37%).

• The relationship between reading performance and time spent using digital devices for schoolwork was negative in 36 countries and economies. In France, the change in reading performance associated with a one-hour increase in the total time a week using digital devices for school is -10 points (OECD average: -7 points) after accounting for students’ and schools' socio-economic status. In Australia, Denmark, Korea, New Zealand, and the United States, this relationship was positive, after accounting for students and schools’ socio-economic status.

Figure 2. Indicators of reading in a digital world
Key features of PISA 2018

The content

- The PISA 2018 survey focused on reading, with mathematics, science and global competence as minor areas of assessment. PISA 2018 also included an assessment of young people's financial literacy, which was optional for countries and economies.

The students

- Some 600 000 students completed the assessment in 2018, representing about 32 million 15-year-olds in the schools of the 79 participating countries and economies.

The assessment

- Computer-based tests were used in most countries, with assessments lasting a total of two hours. In reading, a multi-stage adaptive approach was applied in computer-based tests whereby students were assigned a block of test items based on their performance in preceding blocks.

- Test items were a mixture of multiple-choice questions and questions requiring students to construct their own responses. The items were organised into groups based on a passage of text describing a real-life situation. About 930 minutes of test items for reading, mathematics, science and global competence were covered, with different students taking different combinations of test items.

- Students also answered a background questionnaire, which took about 35 minutes to complete. The questionnaire sought information about the students themselves, their attitudes, dispositions and beliefs, their homes, and their school and learning experiences. School principals completed a questionnaire that covered school management and organisation, and the learning environment.

- Some countries/economies also distributed additional questionnaires to elicit more information. These included: in 19 countries/economies, a questionnaire for teachers asking about themselves and their teaching practices; and in 17 countries/economies, a questionnaire for parents asking them to provide information about their perceptions of and involvement in their child's school and learning.

- Countries/economies could also choose to distribute three other optional questionnaires for students: 52 countries/economies distributed a questionnaire about students’ familiarity with computers; 32 countries/economies distributed a questionnaire about students' expectations for further education; and 9 countries/economies distributed a questionnaire, developed for PISA 2018, about students' well-being.

What is unique about PISA?

PISA is unique because of its:

- policy orientation, which links data on student learning outcomes with data on students’ backgrounds and attitudes towards learning, and with key factors that shape their learning in and outside of school; by doing so, PISA can highlight differences in performance and identify the characteristics of students, schools and education systems that perform well.

- innovative concept of “literacy”, which refers to students’ capacity to apply their knowledge and skills in key areas, and to analyse, reason and communicate effectively as they identify, interpret and solve problems in a variety of situations.

- relevance to lifelong learning as PISA asks students to report on their motivation to learn, their beliefs about themselves, and their learning strategies.

- regularity, which enables countries to monitor their progress in meeting key learning objectives.

- breadth of coverage, which, in PISA 2018, encompassed all 37 OECD countries and 42 partner countries and economies.

1 The socio-economic profile is measured by the PISA index of economic, social and cultural status (ESCS). A socio-economically disadvantaged (advantaged) school is a school in the bottom (top) quarter of the ESCS in the relevant country/economy.

2 The socio-economic profile is measured by the PISA index of economic, social and cultural status (ESCS). A socio-economically disadvantaged (advantaged) student is a student in the bottom (top) quarter of the ESCS in the relevant country/economy.

3 Rapa Nui Question 3 is a partial credit item where non-credit is scored 0, partial credit is scored 0.5, and full credit is scored 1. Therefore, the estimated percentage correct for full credit in this item is lower than 47%, on average across OECD countries. This item was estimated to be 39% correct, on average across all PISA 2018 participating countries and economies. Rapa Nui Question 3 is a Level 5 item. This means that students need to have a proficiency level 5 to have a 62% probability of getting full credit in this item (see Figure I.2.1, [OECD, 2019(a)]).
