The Programme for International Student Assessment (PISA) is a triennial survey of 15-year-old students that assesses the extent to which they have acquired the key knowledge and skills essential for full participation in society. In 2018, PISA measured financial literacy for the third time. Results from this assessment provide not just insights into the level of money-related skills and knowledge that students possess, but also into their attitudes, behaviours and experience with financial matters, and the environments in which they learn about financial matters. These results can be used to improve their readiness to take responsible financial decisions and financial resilience once they leave school and enter further education or employment.

### Australia

**What 15-year-old students in Australia know and can do in financial literacy**

- Students in Australia scored, on average, 511 points, which was higher than the OECD average in financial literacy (505 points). Overall, their scores were most similar to those of students in Portugal and the United States.
- Some 16% of students in Australia did not reach the baseline level of proficiency (Level 2) in financial literacy, compared to 15% on average across OECD countries and economies. At best, these students can identify common financial products and terms, recognise the difference between needs and wants, and make simple decisions on everyday spending in contexts that they are likely to have encountered personally. Over 90% of students in the Canadian provinces, Estonia, Finland and Poland displayed at least Level 2 proficiency.
- Some 14% of students in Australia were top performers (Level 5) in financial literacy, compared to 10% on average across OECD countries and economies. These students can analyse complex financial products, solve non-routine financial problems and show an understanding of the wider financial landscape. Over 15% of students in the Canadian provinces, Estonia and Finland were also top performers.
- Mean financial literacy performance in Australia in PISA 2018 was 15 points lower than that observed in PISA 2012, but similar to that observed in PISA 2015.
- Students in Australia scored, on average, 4 points higher in financial literacy than what would have been expected based on their performance in mathematics and reading.

Figure 1. Percentage of students at each level of proficiency in financial literacy

Equity in financial literacy performance

- On average across participating OECD countries and economies, boys outperformed girls by just two score points. In Australia, the gender gap in financial literacy was not significant. The gender gap in PISA 2018 was not significantly different from what it was in PISA 2012, when it was also not significant; but the gender gap in PISA 2018 was less in favour of girls than it was in PISA 2015, when it was 12 score points in favour of girls.
After accounting for performance in mathematics and reading, the average difference in performance was now 8 score points in favour of boys. This difference is related to the elements of the assessment that are unique to financial literacy.

In Australia, advantaged students scored 556 points in the PISA 2018 financial literacy assessment, on average, while disadvantaged students scored 467 points. Advantaged students scored 89 points higher than disadvantaged students, which was wider than the average performance gap of 78 score points across OECD countries/economies.

Socio-economic status was a strong predictor of performance in financial literacy in all participating countries and economies. In Australia, it explained 10% of the variation in financial literacy performance in PISA 2018, which was similar to the 10% of the variation that it explained on average across OECD countries/economies.

In 2018, some 27% of students in Australia had an immigrant background. The average difference in financial literacy performance between immigrant and non-immigrant students in Australia was not significant. After accounting for performance in mathematics and reading, where immigrant students tended to perform better than or not significantly differently from non-immigrant students, the average difference in performance remained non-significant.

How experienced are students in Australia with money matters?

In Australia, 68% of students who sat the PISA 2018 financial literacy assessment reported holding an account with a bank, building society, post office or credit union (hereafter referred to as a bank account). This was less than the percentage of students who so reported in PISA 2012 (82%) and in PISA 2015 (79%). On average across OECD countries/economies in 2018, 54% of students reported holding a bank account.

Likewise, in Australia, 61% of students who sat the PISA 2018 assessment reported holding a payment card or debit card. This was significantly more than the percentage of students who so reported in PISA 2012 (26%) and PISA 2015 (33%). On average across OECD countries/economies in 2018, 45% of students reported holding such a card.

Socio-economic advantage was positively associated with the likelihood of holding both a bank account and a payment/debit card in all countries/economies that participated in PISA 2018.

Holding a bank account was associated with a 37-point increase in financial literacy performance, while holding a payment/debit card was associated with a no significant change in financial literacy performance in Australia in PISA 2018.
Some 75% of students in Australia reported that they had bought something on line (either alone or with a family member) during the 12 months prior to sitting the PISA 2018 financial literacy assessment, compared to an average across OECD countries/economies of 73%. In Australia, buying something on line was associated with a 13-point increase in financial literacy performance.

Making a payment using a mobile phone was less common. Some 47% of students in Australia reported that they had made such a payment during the 12 months prior to sitting the PISA 2018 financial literacy assessment; the average across OECD countries/economies was 39%. In Australia, making a payment using a mobile phone was associated with a 20-point decrease in financial literacy performance.

What attitudes and behaviours towards money matters do students in Australia display?

In Australia, 77% of students reported that they feel confident or very confident in paying with a debit card instead of using cash, compared to 67% of students on average across OECD countries/economies. Such students scored 31 points higher in financial literacy than students who reported otherwise.

Likewise, some 79% of students in Australia reported that they feel confident or very confident in keeping track of their balance digitally, compared to 65% of students on average across OECD countries/economies. Such students scored 42 points higher in financial literacy than students who reported otherwise.

Positive associations between both confidence in paying with a debit card instead of using cash and confidence in keeping track of one’s balance digitally, on the one hand, and performance, on the other, were observed in 18 of the 19 participating countries/economies.

In Australia, 51% of students agreed or strongly agreed that they enjoy talking about money matters. This disposition was associated with a 13-score point increase in financial literacy performance.
• Most 15-year-old students in all participating countries/economies already display responsible financial behaviours. Just under nine in ten students, on average across OECD countries/economies, reported that they had checked how much money they have at some point during the 12 months prior to sitting the PISA financial literacy assessment (92% in Australia), and a similar proportion reported that they had checked that they were given the right change when they had bought something over the same period (88% in Australia).

• In Australia, students who reported that they had checked how much money they have scored 52 points higher in financial literacy than students who did not so report; and students who reported that they had checked that they were given the right change after buying something scored 43 points higher in financial literacy than students who did not so report.

• Most 15-year-old students in almost all participating countries/economies also already use responsible spending strategies. In Australia, 84% of students reported sometimes or always comparing prices in different shops, compared to 76% on average across OECD countries/economies. Such students scored 63 points higher in financial literacy in PISA 2018 than students who did not so report.

• Some 78% of students in Australia reported sometimes or always comparing prices between a physical shop and an online shop, compared to 69% on average across OECD countries/economies. These students scored 39 points higher in financial literacy in PISA 2018 than students who did not so report.

Do students in Australia learn about financial matters at home?

• Some 96% of students in Australia reported obtaining information about money matters from their parents, guardians or other adult relations; this was consistent with a high average of 94% of students reporting so, on average across OECD countries/economies.

• The Internet was another common source of information about money matters, with 65% of students in Australia reporting that they obtain such information through this medium.

• In Australia, students who reported obtaining information about money matters from their parents, guardians or other adult relations scored 24 points higher on the PISA 2018 financial literacy assessment than students who did not so report.

• Most students in Australia reported that they were given a certain level of autonomy in handling money: some 89% agreed or strongly agreed that they could decide independently what to spend their money on, and some 85% agreed or strongly agreed that they were responsible for their own money matters (e.g. for preventing theft). Being able to decide independently what to spend one’s money on was associated with a 36 score-point improvement in financial literacy performance, while being responsible for one’s own money matters was associated with no significant change in financial literacy performance.

Do students in Australia learn about financial matters at school?

• Advantaged students were more likely than disadvantaged students to report having encountered certain money-related tasks and activities in school lessons in Australia.

• Some 61% of students in Australia reported encountering certain types of problems about money matters in their mathematics classes. Reporting that they encountered such problems in their mathematics classes was associated with a 31-point improvement in financial literacy performance in PISA 2018.

• A smaller percentage of students, 30%, in Australia reported encountering these types of problems about money matters in another class; reporting that they encountered such problems in these other classes was associated with an 11-point improvement in financial literacy performance in PISA 2018.
Key features of PISA 2018

The content

- The PISA 2018 survey focused on reading, with mathematics, science and global competence as minor areas of assessment; Australia did not participate in the assessment of global competence. PISA 2018 also included an assessment of young people’s financial literacy, which was optional for countries and economies. Results for reading, mathematics and science were released on 3 December 2019; results for financial literacy on 7 May 2020; and results for global competence will be released later in 2020.

The students

- Some 600 000 students completed the main assessment in 2018, representing about 32 million 15-year-olds in the schools of the 79 participating countries and economies. The financial literacy sample in PISA 2018 was comprised of around 117 000 students, representing about 13.5 million 15-year-old students in the schools of 20 participating countries and economies. In Australia, 9 411 students, in 763 schools, completed the financial literacy assessment, representing 257 779 15-year-old students (89% of the total population of 15-year-olds).

The assessment

- Computer-based tests were used in most countries, with assessments lasting a total of two hours. All countries/economies that participated in financial literacy delivered the assessment on the computer. In reading, a multi-stage adaptive approach was applied in computer-based tests whereby students were assigned a block of test items based on their performance in preceding blocks.
- Test items were a mixture of multiple-choice questions and questions requiring students to construct their own responses. The items were organised into groups based on a passage of text describing a real-life situation.
- Students also answered a background questionnaire, which took about 35 minutes to complete. The questionnaire sought information about the students themselves, their attitudes, dispositions and beliefs, their homes, and their school and learning experiences. This questionnaire also included questions about students’ relationship with financial matters, including where they obtained information about financial matters, and their attitudes, behaviours and experiences with financial matters.
- Some countries/economies also distributed additional questionnaires to elicit more information. These included a questionnaire for teachers asking about themselves and their teaching practices; a questionnaire for parents asking them to provide information about their perceptions of and involvement in their child’s school and learning; a questionnaire about students’ familiarity with computers; a questionnaire about students’ expectations for further education; and a questionnaire, developed for PISA 2018, about students’ well-being.
