

Unemployment rate falls slightly in the OECD area, reaching 5.7% in October 2021

The unemployment rate in the **OECD area** fell for the sixth consecutive month in October 2021, to 5.7% (from 5.8% in September), but at a slower pace than in previous months. It remained 0.5 percentage point above the pre-pandemic rate recorded in February 2020. The number of unemployed workers across the **OECD area** also continued to fall (by 0.2 million), reaching 38.3 million, still 2.8 million above the pre-pandemic level. The unemployment rate in the **OECD area** was stable among **women** (at 6.0%) and declined slightly among **men** (to 5.5%, from 5.6% in September). Unemployment also declined slightly among **prime age and older workers** aged 25 and above (down to 4.9%, from 5.0% in September), but edged up among **younger people** aged 15 to 24 (up to 12.1%, from 12.0%).

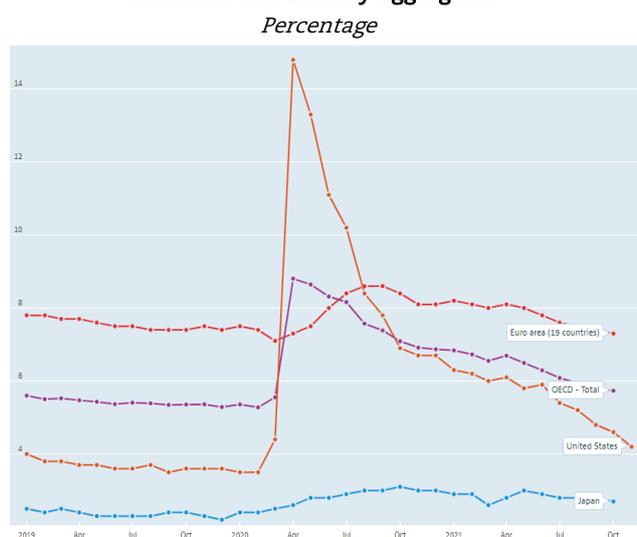

The fall in the **OECD area** unemployment rate when compared with the April 2020 peak should be interpreted with caution, as it largely reflects the return of temporary laid-off workers in the **United States** and **Canada**, where they are recorded as unemployed, unlike in most other countries, including European member states, where they are recorded as employed. In addition, methodological changes to the EU Labour Force Survey blur the comparison for several European Union countries between December 2020 and subsequent months¹. Furthermore, the unemployment rate may conceal additional slack in the labour market as some non-employed people may be “out of the labour force”, either because they are not able to actively look for work or are not available to work.

In the **euro area**, there was another slight decrease in the unemployment rate in October (to 7.3%, from 7.4% in September), with the largest declines in **Greece** (to 12.9%, from 13.1%), **Lithuania** (to 6.5%, from 6.7%), **Luxembourg** (to 5.1%, from 5.3%) and **the Netherlands** (to 2.9%, from 3.1%). In contrast, the largest increases were observed in **Austria** (to 5.8%, from 5.2%) and **Italy** (to 9.4%, from 9.2%).

In October, the unemployment rate increased by 0.6 percentage point in **Australia**, to 5.2%, close to the pre-pandemic rate. It also increased in **Colombia** (to 13.0%, from 12.7% in September) and **Korea** (to 3.2%, from 3.0%), but declined in **Canada** (to 6.7%, from 6.9%), **Israel** (to 5.0% from 5.1%), **Japan** (to 2.7%, from 2.8%) and the **United States** (to 4.6%, from 4.8%). It was stable in **Mexico** (at 3.9%). More recent data show that in November, the unemployment rate declined further in **Canada** (by 0.7 percentage point, to 6.0%) and the **United States** (by 0.4 percentage point, to 4.2%).

Notes:

(1) Provisional data for Austria and Italy, for Germany from February 2021.

(2) Belgium, the Czech Republic, Denmark, Germany, Greece, Ireland, Latvia, Lithuania, Luxembourg, Poland, the Slovak Republic, Slovenia and Sweden: from January 2021, data are compliant with the new Integrated European Social Statistics (IESS) Framework Regulation, while prior to this date, data refer to the former definition.

(3) Canada: Unemployment rate for November 2021 was 6.0%.

(4) Mexico: April, May and June 2020 monthly figures are based on the INEGI Encuesta Telefónica de Ocupación y Empleo (ETOE) phone survey. These data are not strictly comparable with the results for earlier months. Data from July 2020 are based on the new Encuesta Nacional de Ocupación y Empleo (ENOE) survey, combining telephone and face-to-face interviews.

(5) United States: Unemployment rate for November 2021 was 4.2%.

Notes:

(1) Provisional data for Austria and Italy, for Germany from February 2021.

(2) Belgium and Slovenia: For youth unemployment, quarterly data are shown.

(3) Belgium, the Czech Republic, Denmark, Germany, Greece, Ireland, Latvia, Lithuania, Luxembourg, Poland, the Slovak republic, Slovenia and Sweden: from January 2021, data are compliant with the new Integrated European Social Statistics (IESS) Framework Regulation, while prior to this date, data refer to the former definition.

(4) Israel: Data shown in this table are not seasonally adjusted.

(5) Mexico: April, May and June 2020 monthly figures are based on the INEGI ETOE phone survey. These data are not strictly comparable with the results for earlier months. Data from July 2020 are based on the New ENOE survey, combining telephone and face-to-face interviews.

(2) Belgium, the Czech Republic, Denmark, Germany, Greece, Ireland, Latvia, Lithuania, Luxembourg, Poland, the Slovak Republic, Slovenia and Sweden: from January 2021, data are compliant with the new Integrated European Social Statistics (IESS) Framework Regulation, while prior to this date, data refer to the former definition.

(3) Mexico: April, May and June 2020 monthly figures are based on the INEGI ETOE phone survey. These data are not strictly comparable with the results for earlier months. Data from July 2020 are based on the New ENOE survey, combining telephone and face-to-face interviews.

Note: Employment and unemployment statistics during the COVID-19 crisis

The broad comparability of unemployment data across OECD countries is achieved through the adherence of national statistics to International Guidelines from the International Conference of Labour Statisticians (ICLS) – the so-called ILO guidelines.

Departures from these guidelines may however exist across countries depending on national circumstances (e.g. statistical environment, national regulations and practices). Typically, these departures have only a limited impact on broad comparability of employment and unemployment statistics. However, the unprecedented impact of COVID-19² is amplifying divergences and affects the cross-country comparability of unemployment statistics in this news release.

This concerns in particular the treatment of persons on temporary layoff or employees furloughed by their employers. These are *persons not at work during the survey reference week due to economic reasons and business conditions* (i.e. lack of work, shortage of demand for goods and services, business closures or business moves).

According to ILO guidelines, ‘**employed**’ persons include those who, in their present job, were ‘not at work’ for a short duration but maintained a job attachment during their absence (ILO, 2013 and 2020). Job attachment is determined on the basis of the continued receipt of remuneration, and/or the total duration of the absence. In practice, formal or continued job attachment is established when:

- *the expected total duration of the absence is up to three months (which can be more than three months, if the return to employment in the same economic unit is guaranteed and, in the case of the pandemic, once the restrictions in place - where applicable - are lifted)*

OR

- *workers continue to receive remuneration from their employer, including partial pay, even if they also receive support from other sources, including government schemes.*

In turn persons are classified as ‘**not employed**’ if:

- *The expected total duration of absence is greater than three months or there is no or unknown expected return to the same economic unit*

AND

- *People in this condition do not receive any part of their remuneration from their employer.*

Not-employed persons are classified as ‘**unemployed**’ if they fulfil the criteria of active “job search”³ and “availability” specified for the measurement of unemployment.

However, departures from these guidelines in national practices do exist. In North America persons on temporary layoff are considered to be “only weakly or not at all attached to their job and are to be counted as unemployed” (Sorrentino, 2000). In the United States, people on temporary layoff are classified as ‘unemployed’ if they expect to be recalled to their job within six months. If they have not been given a date to return to work by their employer and if they have no expectation to return to work within six months, they need to fulfil the “job search” criteria to be classified as ‘unemployed’. For the latest US figures “people who were effectively laid off due

² Broad comparability is ensured during normal business conditions, while divergences are potentially exacerbated during economic and financial crises, such as the Great Recession or the Covid-19 crisis.

³ Some people not in employment may be classified as “inactive/out of the labour force” because, due to the pandemic, they are either not able to actively look for a job even if they are available to work or are not available to work because of family responsibilities as schools and care services are closed.

to pandemic-related closures were counted among the unemployed on temporary layoff” without further testing for their return to their previous job (BLS, 2020). In Canada, persons in temporary layoff are also classified as ‘unemployed’ if they have a date of return or an indication that they will be recalled by their employers.

Conversely, persons on temporary layoff are classified as employed (not at work) in Europe, as recommended by the ILO Guidelines (Eurostat, 2016). In practice, formal job attachment is tested on the basis of (i) an assurance of return to work within a period of three months or (ii) the receipt of half or more of their wage or salary from their employer. Somewhat stricter than ILO guidance, absences during COVID-19 crisis whose duration is unknown are treated as absences longer than three months. Those failing to satisfy these two criteria are classified as unemployed if they are “available to start work” (over the next two weeks) and have actively searched for a job in the last four weeks. All other persons on layoff are classified as inactive.

[Methodological Notes for OECD Unemployment Rates News Release](#)

The OECD area unemployment rate is calculated as the total number of unemployed people in all OECD countries as a percentage of the total labour force (i.e. the unemployed plus those in employment); this is equivalent to an average of unemployment rates of all OECD countries weighted by the labour force of each country. Rates and levels are seasonally adjusted (s.a.).

For countries for which unemployment data for the most recent month or quarter are not available, the latest available data are used to compile data for the OECD area total.

OECD Online Database: [OECD Short-Term Labour Market Statistics](#)

Statistical data for Israel are supplied by and under the responsibility of the relevant Israeli authorities. The use of such data by the OECD is without prejudice to the status of the Golan Heights, East Jerusalem and Israeli settlements in the West Bank under the terms of international law.

New methodology in the **EU Labour Force Survey** from 2021 with the entry into force of the Integrated European Social Statistics (IESS) Framework Regulation, resulted in [updated definitions of the labour status](#). These changes may affect comparisons for several EU countries between December 2020 and subsequent months. Information, by European country, on the status of the implementation of IESS regulation as well as on possible resulting breaks in time series can be found in a Eurostat Statistics Explained [article](#).

The measures put in place by national governments to reduce the spread of the Coronavirus (COVID-19) may have impacted on the ability to field surveys, and so, in turn, on the quality of statistics typically produced. In addition, because of differences in national practices used to determine whether individuals are unemployed when under confinement, international comparability has also been affected. See the **note above on the divergence in employment and unemployment statistics during the COVID-19 crisis**.
