R&D Tax Incentives: France, 2020

Design of R&D tax relief provisions

France provides R&D tax relief through a volume-based tax credit - Crédit d’Impôt Recherche (CIR) - and an exemption from social security contributions (SSC) for young and innovative firms (JEI/JEU).

JEI: Young Innovative Firm; JEU: Young University Firm; PRO: Public Research Organization; SSC: Social Security contributions. *France also offers an accelerated depreciation of machinery and equipment used in the process of R&D (declining balance method at a rate of 40%); **: 50 for firms in French overseas territories; *** Private subcontracted R&D expenses are capped at an amount equal to three times all other qualifying expenses with a limit of EUR 10 million. France also offers income-based tax incentives for outcomes of R&D activities. These are beyond the scope of this note.

Note: For more details, see OECD R&D Tax Incentive Compendium and Eligibility of current and capital expenditure for R&D tax relief

Key features:

- The headline rate of the R&D tax credit is 30%, falling to 5% for R&D expenditure above the threshold of EUR 100 million.
- Unused tax credits are refunded in the case of SMEs; a three-year carry-forward is available to large firms. Any outstanding credits are refundable after that period.
- Different ceilings apply to subcontracted R&D, depending on the type of R&D service provider.

Generosity of R&D tax support in 2020

Differences in the design of R&D tax incentives drive significant variation in the expected generosity of tax relief per additional unit of R&D investment. France offers one of the most generous R&D tax incentives among OECD and partner economies. In 2020, the marginal tax subsidy rate for profit-making (loss-making) SMEs in France is estimated at 0.41 (0.41), significantly above the OECD median of 0.20 (0.18). The tax subsidy rate for large enterprises is equal to 0.41 (0.32) in the profit (loss) -making scenario, well above the OECD median of 0.17 (0.15). These estimates focus on the R&D tax credit (CIR) and accelerated depreciation provision.

Figure 1. Implied tax subsidy rates on R&D expenditures: France, 2020

1-B-Index, by firm size and profit scenario

Note: Implied marginal tax subsidy rates, presented for different firm size and profitability scenarios, are calculated based on headline tax credit/allowance rates (see methodology and country-specific notes), providing an upper bound value of the generosity of R&D tax support, not reflecting the effect of thresholds and ceilings that may limit the amount of qualifying R&D expenditure or value of tax relief.

Recent developments in R&D tax relief provisions

Regular reforms of R&D tax incentives lead to continuous changes in the availability, scope and generosity of R&D tax incentives. Such reforms relate to the launch of new tax incentives, the R&D definition adopted for tax purposes, changes in tax credit and allowance rates, adjustments of thresholds or upper ceilings on qualifying R&D expenditure or tax relief amounts, or changes in the terms and availability of refunds.

In 2020, changes in the availability and scope of R&D tax incentives represented the most frequent type of policy reform (OECD, 2020), along with adjustments to the headline R&D tax credit/allowance rates and adjustments of thresholds or upper ceilings on qualifying R&D expenditure or tax relief amounts. In response to the COVID-19 pandemic, several countries increased the generosity of R&D tax relief or introduced modifications to the administration of R&D tax incentives to facilitate and accelerate R&D funding.

In 2020, France undertook two changes in its R&D tax relief provisions:

- The JEI/JEU tax exemption was extended until December 31, 2022.
- In response to the COVID-19 crisis, France introduced expedited cash payments (refunds) for the CIR: all eligible companies were able to request the early repayment of corporate tax claims refundable in 2020 from the Direction Générale des Finances Publiques. Start-ups, SMEs and JEIs could apply for the immediate refund of the 2019 CIR without waiting to fill out their income tax return.

Trends in the generosity of R&D tax support

The generosity of R&D tax incentives has increased significantly in France over the 2000-20 period. In 2004, the incremental R&D tax credit was extended to include a volume-based component. While the rate of the incremental tax credit was successively lowered over the 2000-2006 period, the rate of the volume-based tax credit was doubled from 5% to 10% in 2006.

In 2008, the French R&D tax credit became entirely volume-based and the tax credit rate was raised to 30% for eligible R&D expenditure up to EUR 100 million, leading to a substantial increase in the implied marginal tax subsidy rates estimated for firms in the profit (loss)-making scenario. Tax subsidy rates are identical for all types of firms in 2008 due to a temporary relief measure, allowing both SMEs and larger firms an immediate refund of all unused credits related to the 2008 and residual claims from 2007, 2006 and 2005, instead of a 3 year waiting period. As a result, identical tax subsidy rates are estimated for profitable and loss-making firms.

Over the 2010-20 period, changes in the value of baseline tax deductions, linked to adjustments in the statutory corporate income tax (CIT) rate, led to some smaller-scale fluctuations in the tax subsidy rates in each of the four scenarios considered. France raised its CIT rate from 34.4% to 36.1% in 2011 and from 36.1% to 38% in 2013, leading to an increase of the value of baseline tax deductions and small increase in tax subsidy rates. Similarly, reductions in the CIT rate from 38% to 34.4% in 2016 and from 34.4% to 32% in 2020 led to a reduction in the value of baseline tax deductions and a small drop in implied marginal R&D tax subsidy rates.

For R&D expenditure above 100 EUR million, a tax credit rate of 5% applies. If this threshold is considered in the modelling, the R&D tax subsidy rate for large firms drops from 0.41 (0.32) to 0.36 (0.29) in the profit (loss-) making scenario, while the one for SMEs, operating below this threshold, remains unchanged.

Note: Implied marginal tax subsidy rates, presented for different firm size and profitability scenarios, are calculated based on headline tax credit/allowance rates (see methodology and country-specific notes), providing an upper bound value of the generosity of R&D tax support, not reflecting the effect of thresholds and ceilings that may limit the amount of qualifying R&D expenditure or value of tax relief.

Policy support for business R&D: the policy mix

**France** is the OECD country that provides the largest level of total government support to business R&D as a percentage of GDP, at a rate equivalent to 0.40% of GDP in 2017 (latest figure available). This is twice as much as the equivalent for the entire OECD area.

**Figure 3. Direct government funding of business R&D and tax incentives for R&D, 2018 (nearest year)**

As a percentage of GDP

**Note:** Data on subnational tax support are only available for a group of countries.

**Source:** OECD, R&D Tax Incentives Database, [http://oe.cd/rdtax](http://oe.cd/rdtax), March 2021.

**Key points:**
- From 2006 to 2017, government support for BERD as a percentage of GDP increased in France by 0.17 percentage point (pp), while the OECD average (2006-2018) increased by 0.03 pp.
- From 2006 to 2017, business R&D intensity in France increased from 1.29% to 1.44%.
- In 2017, R&D tax incentives accounted for 71% of total government support for BERD in France.

**Distribution of R&D tax relief recipients and government tax relief for R&D**

The distribution of R&D tax relief recipients and government tax relief for R&D expenditures (GTARD) provide insights into what types of firms claim and benefit from tax relief.

**Note:** Figures refer to the CIR and JEI/JEU except for the distribution of tax relief recipients by industry where available figures refer to the CIR in 2006. *SMEs are defined as firms with 1-249 employees. **Economic activity is classified based on NAF rév2.

**Source:** OECD, R&D Tax Incentives Database, [http://oe.cd/rdtax](http://oe.cd/rdtax), March 2021.

**Key points:**
- In France, SMEs accounted for 86% of R&D tax relief recipients in 2017, while the share of R&D tax support accounted for by SMEs amounted to around 30% in this year. 70% of R&D tax benefits were allocated to large firms, comprising 14% of the population of R&D tax relief recipients in 2017.
- In 2017, firms in services represented around 60% of R&D tax relief recipients in France, followed by firms in manufacturing with a share of 34%. The share of R&D tax benefits accounted for the latter amounted to 60% in that year, while this share amounted to 38% in the case of firms in services.
Trends in the uptake of R&D tax incentives

Over the period 2000-2017, the number of R&D tax relief recipients increased more than six fold in France, reaching close to 19 700 in 2017. Most of this increase is attributable to SMEs. Between 2005 and 2012 (the period for which relevant data are available), the number of SMEs receiving R&D tax support increased from around 5 600 to 16 870, while the number of large firms receiving tax support increased from around 300 to 2 830. Over the 2005-17 period, SMEs accounted for more than 80% of R&D tax relief recipients in France, with the exception of the years 2013-14 where the number of SME recipients temporarily declined, compensated by an increase in the number of large firms receiving R&D tax support.

Figure 5. Number of R&D tax relief recipients, France, 2000-2017

Note: Figures refer to the CIR and JEI/JEU.

Trends in government support for business R&D

Between 2000 and 2017, the importance of R&D tax support has increased significantly in France, both in absolute and relative terms.

Figure 6. Direct funding of business R&D and tax incentives for R&D, France, 2000-17

As a percentage of GDP, 2015 prices (right-hand scale)

- As percentage of GDP, R&D tax support increased from 0.04% to 0.29% of GDP during this period.
- Direct funding of BERD, on the contrary, has remained fairly constant over the 2000-17 period, representing 0.13% and 0.12% of GDP in 2000 and 2017 respectively.
- The share of R&D tax incentives in total government support increased significantly over this period, amounting to 22% in 2000, 32% in 2005 and 71% in 2017.
