Preventing Harmful Alcohol Use

Alcohol can be a source of enjoyment and is an important part of the economy in many countries. Yet harmful alcohol use is a leading risk factor for premature death, injuries and many non-communicable diseases. Harmful alcohol use can also affect others, for example in the case of violence and foetal alcohol syndrome. These diseases and injuries, in turn, have an impact on healthcare budgets and the productivity of the labour force.

People in Switzerland consume on average 11.5 litres of pure alcohol per capita per year, roughly equivalent to 2.4 bottles of wine or 4.4 litres of beer per week per person aged 15 and over. In addition, in Switzerland, some population groups are at higher risk than others; specifically:

- **35.6% of adults engage in binge drinking** at least once a month. This corresponds to drinking more than 80% of a bottle of wine or 1.5 litres of beer per occasion.

- Men consume **17.6 litres** of pure alcohol per capita per year while women consume **5.6 litres** per capita per year.

- **10% of girls and 17% of boys** aged 15 have been drunk at least twice in their life. Children who never experienced drunkenness are 20% more likely to perform well at school.

Life expectancy **is 0.7 years lower** over the next 30 years due to disease and injuries caused by drinking more than 1 drink per day for women and 1½ drinks per day for men, on average in the whole population, according to OECD simulations.

Based on current consumption patterns in Switzerland, OECD simulations estimate that diseases and injuries caused by drinking above 1-1½ drinks per day lead to treatment costs equal to **1.9% of health expenditure** and a reduction in the workforce productivity. Consequently, Switzerland’s GDP is estimated to be **1.3% lower** on average between now and 2050, excluding any impact on the alcohol industry. Due to a lower GDP, and to maintain a constant public debt-to-GDP ratio, Switzerland has to raise additional revenues equivalent to an increase in tax of **CHF 274** per person per year.
In Switzerland, investing CHF 3.3 per person per year in the enhanced policy package to tackle harmful alcohol use will:

- prevent 523 thousand non-communicable diseases and injuries by 2050;
- save CHF 141 million per year in health costs;
- increase employment and productivity by the equivalent of 7 thousand full-time workers per year.

For every CHF 1 invested in the policy package, CHF 16 are returned in benefits, not considering any impact on the alcohol industry.

OECD analysis of WHO data reflects the implementation status across policy areas within the WHO’s Global Strategy to Reduce the Harmful Use of Alcohol.

Switzerland performs well in certain policy areas, but there are opportunities for further action. Policy priorities could include:

- Strengthening restriction on availability of alcohol to vulnerable and high-risk groups, for instance by time or place;
- Strengthening penalties against drink-driving to prevent road traffic crashes and injuries;
- Strengthening regulation of advertising on social media and new media, which are frequently used by younger people.

OECD analyses looked at enhanced policy package to tackle harmful alcohol use. The package contains many of the policy priorities for Switzerland, including:

- Strengthening sobriety checkpoints to counter drink-driving
- Complete ban on alcohol advertising to children via traditional and new media, sponsorships, branding and point-of-sale displays
- Alcohol taxation
- Strengthening screening and counselling in primary care
- Strengthening regulation on alcohol advertising, sponsorships, branding and point-of-sale displays
- Minimum unit pricing targeting cheap alcohol

In Switzerland, investing CHF 3.3 per person per year in the enhanced policy package to tackle harmful alcohol use will:
