

## Carbon pricing in Austria

### Share of greenhouse gas emissions subject to a positive price by instrument, 2023 estimates

In total, 69.3% of GHG emissions in Austria are subject to a positive Net Effective Carbon Rate (ECR) in 2023. Explicit carbon prices in Austria consist of the European Union (EU) Emissions Trading System (ETS) and the national ETS permit prices, which cover 78.2% of greenhouse gas (GHG) emissions in CO<sub>2</sub>e. Fuel excise taxes, an implicit form of carbon pricing, cover 52.8% of emissions in 2023. Fossil fuel subsidies cover 11.2% of emissions.

Note: Percentages are rounded to the first decimal place.

### Average effective carbon prices by instrument, real 2023 EUR, 2023 estimates

When measured in real 2023 euros, Net Effective Carbon Rates are EUR 79.86 per tonne of CO<sub>2</sub>e on average in Austria in 2023. Explicit carbon prices reach an average of EUR 41.25. Fuel excise taxes amount to EUR 48.63 on average. Fossil fuel subsidies average EUR 10.01 per tonne of CO<sub>2</sub>e.

Note: Prices are rounded to the nearest eurocent.

## Distribution of effective carbon prices across GHG emissions, 2023 estimates

About 69% of GHG emissions are subject to a positive Net ECR in Austria. About 59% of GHG emissions have a Net ECR above EUR 60 per tonne of CO<sub>2</sub>e, a mid-range estimate of current carbon costs.

Note: Simplified for illustration (the average price for each percentile bracket is shown).

## Average effective carbon prices (left panel) and GHG emissions (right panel) by sector, 2023 estimates

Net Effective Carbon Rates are highest in the road transport sector, which accounts for 27.3% of the country's total GHG emissions. The Net ECR is on average positive in all sectors.

**Notes on all figures:** Tax rates applicable on 1 April 2023, Emission Trading Systems operating in 2023 with ETS coverage estimates based on the OECD's Effective Carbon Rates 2023, i.e. coverage year 2021, and adjustments to account for new systems. Fossil fuel subsidy estimates are based on the OECD's Inventory of Fossil Fuel Support, where available, and original research for the other countries. Due to data availability, fossil fuel subsidy estimates for 2023 are based on data for 2022. GHG emissions are the sum of fossil-fuel related CO<sub>2</sub> emissions, calculated based on energy use data for 2021 from the IEA's World Energy Balances 2023 and other GHGs from Climate Watch 2024.
