Norway

Norway's greenhouse gas (GHG) emissions mainly consist in CO_2 emissions from energy use (77%). In 2021, these emissions are priced through fuel excise taxes, carbon taxes and the European Union Emissions Trading System (EU ETS). Norway priced about 90% of its carbon emissions from energy use and about 62% were priced at an ECR above EUR 60 per tonne of CO_2 (see Figure 3). Emissions priced at this level mainly originated from the road transport and industry sectors as well as the buildings, agriculture and fisheries and offroad transport sectors. The majority of unpriced emissions from energy use were from the industry sector (Figure 2). The EU ETS covered almost 38% of other GHG emissions[1], which made up about 23% of national emissions (see Figure 1).
