This summary presents comparative information on a range of statutory tax rates and tax rate indicators in OECD countries, encompassing personal income tax rates and social security contributions, corporate income tax rates and value-added taxes.

These indicators provide a baseline of information on tax settings in 2019 and in early 2020. Since then, many countries have introduced a range of short-term tax measures in response to COVID-19, which are detailed in https://www.oecd.org/tax/covid-19-tax-policy-and-other-measures.xlsx.
The average tax wedge for all four family types varied significantly between 2000 and 2019. Since 2000, all four family types experienced a continuous decrease in their tax wedge, reaching a temporary low during the financial crisis in 2009. In the three years following the crisis, the tax wedge rose again for all four family types. However, the tax wedge of all four family types is now lower than in 2000.

The average tax wedge measures the effective tax rate on labour costs as the difference between the labour costs to the employer and the corresponding net take-home pay of the employee. It equals the sum of personal income tax, employee and employer social security contributions (SSCs) plus any payroll taxes, minus any cash benefits received by the employee, expressed as a percentage of labour costs (gross wages plus employer SSCs and payroll taxes).

The tax wedge of the average worker is the highest throughout the observed period, now stabilising at 36%, which is close to but slightly below the level of 2000.

A similar trend can be observed for the tax wedge of the two-earner married couple and the tax wedge of the one-earner married couple, which are now at 32.9% and 26.4% respectively.

The average tax wedge of the single person with two children earning 67% of the average wage is the lowest of all four family types throughout the whole period. After experiencing a short increase between 2009 and 2013, it has now reached an all-time low of 15.8% of total labour costs.
OECD average tax wedge, 2000-2019

as % of total labour costs

Compared to 2000, the average OECD tax wedge in 2019 has decreased for all eight family types, on average by 2.2 percentage points. The largest decrease over this period occurred for the single worker with two children earning 67% of the average wage (4.2 percentage points).

The OECD average tax wedge as a share of total labour costs differs significantly across family types. In 2019, it ranged from 15.8% for a single person with two children earning 67% of the average wage to 40.3% for a single person without children earning 167% of the average wage.

Across OECD countries, the sum of income tax, employer social security contributions (SSCs) and employee SSCs as a share of labour costs for the average worker ranged from 52.2% in Belgium to 7.0% in Chile, with an average of 36.0%.

The percentage of labour costs paid in income tax varies considerably across OECD countries. The lowest figures are in Chile (0.05%) and Korea (6.0%) and the highest values are in Denmark (35.6%), with Australia and Iceland both over 20%.

The total of employee and employer SSCs as a percentage of labour costs exceeds 20% in more than half of the OECD countries. In five OECD countries, it represents at least one-third of labour costs: Austria, the Czech Republic, France, Germany and the Slovak Republic.
The tax wedge of the average worker in OECD countries is comprised primarily of employer SSCs (13.8% of labour costs), followed by income tax (13.7%) and employee SSCs (8.5%).

Note: Single individual without children at the income level of the average worker. Includes payroll taxes where applicable. Source: OECD (2020). OECD Tax Database. oe.cd/tax-database.
In 2019, a top statutory PIT rate of more than 30% applied in all but five OECD countries. In three of these countries – the Czech Republic (15%), Estonia (20%) and Hungary (15%) – a single rate PIT applies to all levels of taxable income.

Eleven OECD countries (Sweden, Japan, Denmark, France, Greece, Austria, Canada, Portugal, Belgium, the Netherlands and Finland, listed in descending order) apply a top PIT rate of more than 50%, with thresholds ranging from 1.1 times the average wage in Belgium to 22.7 times the average wage in Austria.

The **top statutory personal income tax (PIT) rate** is the combined central government and sub-central government personal income tax rate that applies for gross wage earnings in the highest earnings bracket of the PIT rate schedule. Tax credits and tax deductions are not taken into account. The earnings threshold is given by the bottom end of this bracket, i.e. the lowest income where the top PIT rate first applies, expressed as a multiple of the average wage.
Top statutory PIT rates, 2019
against their thresholds

Note: The figure includes data for all OECD countries except Mexico. Mexico, which is an outlier, has been excluded to improve the readability of the graph. In Mexico, a top PIT rate of 35% applies above a threshold of 26.6 times the average wage.

In 2019, top PIT rates ranged from more than 55% in Sweden, Japan, Denmark and France to 25% and below in the Slovak Republic, Estonia, the Czech Republic and Hungary.

Compared to 2000, top PIT rates have decreased in the majority of OECD countries, with the largest decrease in Hungary, from 40% to 15%.

However, compared to 2007, 23 OECD countries have increased their top PIT rates, leading to an increase in the OECD average PIT rate between 2007 and 2019.

In 2019, the OECD average top PIT rate reached a level close to 43%, 2.6 percentage points lower than in 2000.
Top statutory PIT rates (in %), 2000, 2007 and 2019

In 2020, combined statutory CIT rates in OECD countries ranged from 9% in Hungary to over 30% in Portugal and France.

Between 2000 and 2020, statutory CIT rates have decreased in all but one OECD country, leading to a decrease in the OECD average statutory CIT rate of 9 percentage points. Five OECD countries (New Zealand, the United States, Norway, Sweden and the United Kingdom) did not change their statutory CIT rates between 2000 and 2007, but lowered them in the years after the 2007 financial crisis.

Chile was the only country to have a higher CIT rate in 2019 compared to 2000, with its CIT rate increasing from 15% to 25%.

The **combined statutory corporate income tax (CIT) rate** shows the combined central and sub-central headline tax rate faced by corporations. It is given by the central government rate (less deductions for sub-national taxes) plus the sub-central rate. Where a progressive (as opposed to flat) rate structure applies, the top marginal rate is shown.
Combined statutory CIT rates (in %), 2000, 2007 and 2020

Note: The averages are unweighted averages. The EU-22 average includes all EU countries that are members of the OECD. The G20 average includes all G20 countries, excluding the EU.
Source: OECD (2020). OECD Tax Database. oe.cd/tax-database
The OECD average, the EU-22 average and the average for the G20 countries average combined statutory CIT rates decreased strongly between 2000 and 2020, most visibly in the course of the financial crisis between 2007 and 2008.

The statutory CIT rate measures the marginal tax that would be paid on an additional unit of income, in the absence of other provisions in the tax code. However, it does not reflect any special regimes or rates targeted to certain industries or income types, nor does it take into account the breadth of the corporate tax base to which the rate applies.

While the OECD average statutory CIT rate was equal to the EU-22 average of 32.2% in 2000, it was more than 1 percentage point higher than the EU-22 average in 2020, at 23.3% compared to 22.2%.

The G20 average was the highest of the three statutory CIT rate averages between 2000 and 2020. The gap between the G20 average and the OECD average statutory CIT rate has remained relatively stable at around 3.5 percentage points throughout the period.
Combined statutory CIT rates (in %), 2000-2020

Note: The averages are unweighted averages. The EU-22 average includes all EU countries that are members of the OECD. The G20 average includes all G20 countries, excluding the EU.

In 2019, standard VAT rates ranged from 27% in Hungary to less than 10% in Japan, Switzerland and Canada.

Compared to 2005, the standard VAT rate increased in two thirds of OECD countries (24), leading to an increase in the OECD average standard VAT rate. Since reaching its peak of 19.3% in 2015, the OECD average standard VAT rate has remained stable.

In 2019, the average standard VAT rate of the 22 OECD countries that are members of the EU was at 21.8%, which is significantly higher than the OECD average.
Standard VAT rates (in %), 2005 and 2019

Note: The averages are unweighted averages including the countries for which data was available by the time this graph was composed. The OECD average includes all OECD countries but the United States (which do not apply a VAT). The EU-22 average includes all OECD countries that are members of the EU. Country-specific notes can be found here: https://www.oecd.org/tax/consumption-tax-trends-19990979.htm
